Do not turn the page until you are instructed to do so.

Name of Student: __________________________

Rules/Guidelines:
- You must not begin working before time begins, and you must stop working promptly when time is called. Any modifications to your exam (writing or erasing) before time begins or after time is called will result in a penalty.
- You are allowed one page of notes, no larger than 8.5 x 11 inches. You may not access any other resources or use any electronic devices (including calculators, phones, or smart watches, among others) during the exam. Using unauthorized resources or devices will result in a penalty.
- In general, you are limited to Java concepts or syntax covered in class. You may not use break, continue, a return from a void method, try/catch, or Java 8 features.
- You are limited to the standard Java classes and methods listed on the provided reference sheet. You do not need to write import statements.
- If you abandon one answer and write another, clearly cross out the answer(s) you do not want graded and draw a circle or box around the answer you do want graded. When in doubt, we will grade the answer that appears in the space indicated, and the first such answer if there is more than one.
- If you require scratch paper, raise your hand and we will bring some to you.
- If you write an answer on scratch paper, please write your name and clearly label which question you are answering on the scratch paper, and clearly indicate on the question page that your answer is on scratch paper. Staple all scratch paper you want graded to the end of the exam before turning in.
- Answers must be written as proper Java code. Pseudocode or comments will not be graded.
- The exam is not graded on code quality. You are not required to include comments.
- You are also allowed to abbreviate "System.out.print" and "System.out.println" as "S.o.p" and "S.o.pln" respectively. You may NOT use any other abbreviations.

Grading:
- Each problem will receive a single E/S/N grade.
  - On problems 1 through 3, earning an E requires answering all parts correctly and earning an S requires answering almost all parts correctly.
  - On problems 4 through 6, earning an E requires an implementation that meets all stated requirements and behaves exactly correctly in all cases. Earning an S requires an implementation that meets all stated requirements and behaves exactly correctly in most cases or behaves nearly correctly in all cases.
- Minor syntax errors will be ignored as long as it is unambiguous what was intended (e.g. forgetting a semicolon, misspelling a variable name where there is only one close option). Major syntax errors, or errors where it is unclear what was intended, may have an impact on your grade.

Advice:
- Read all questions carefully. Be sure you understand the question before you begin your answer.
- The questions are not necessarily in order of difficulty. Feel free to skip around. Be sure you are able to at least attempt every question.
- Write clearly and legibly. We cannot award credit for answers we cannot read.
- If you have questions, raise your hand to ask. The worst that can happen is we will say "I can't answer that."
- Ask questions as soon as you have them. Do not wait until you have several questions.

Initial here to indicate you have read and agreed to these rules: __________________________
1. Code Comprehension

**Part A:** For the following binary tree, write the preorder, inorder, and postorder traversal.

```
        4
       /   \
     2     1
    / \   / \ 
   7   3 8   5
  / \ / \ /  \
 9 6 0
```

**Preorder:** ____________________________

**Inorder:** ____________________________

**Postorder:** __________________________

**Part B:** (Select all that apply) Which of these statements are true about inheritance?

- [ ] Inheritance allows a subclass to access all private properties and methods of its parent class.
- [ ] Calling a method using `super` will go to the parent class one level above the current subclass.
- [ ] To indicate that class A is a subclass of B, we write `public class B extends A`
- [ ] Parent classes can call the methods of their subclasses.
- [ ] If class A is a subclass of B, then the following statement is legal:
  ```java
  B a = new A();
  ```
Part C: Consider the following method in the IntTree class:

```java
public List<String> method() {
    List<String> result = new ArrayList<>();
    methodHelper(overallRoot, result, "");
    return result;
}

private void methodHelper(TreeNode root, List<String> result, String s) {
    if (root != null) {
        s += root.data;
        if (root.left == null && root.right == null) {
            result.add(s);
        } else {
            s += "", ";
            methodHelper(root.left, result, s);
            methodHelper(root.right, result, s);
        }
    }
}
```

Provide a tree that, if called by the above method, would result in a list of size 3.
2. Code Tracing

**Part A:** For each of the following, write the code necessary to convert the following sequences of ListNode objects:

<table>
<thead>
<tr>
<th>Before:</th>
<th>After:</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Before:</th>
<th>After:</th>
</tr>
</thead>
</table>
Part B: Consider the following classes:

```java
public class Leela extends Fry {
    public void method1() {
        System.out.print("Leela1 ");
    }

    public void method2() {
        System.out.print("Leela2 ");
        super.method2();
    }
}

public class Farnsworth extends Bender {
    public void method1() {
        System.out.print("Farnsworth1 ");
    }

    public String toString() {
        return "Good news everyone!";
    }
}

public class Fry extends Bender {
    public void method2() {
        System.out.print("Fry2 ");
        super.method2();
    }
}

public class Bender {
    public void method1() {
        System.out.print("Bender1 ");
    }

    public void method2() {
        System.out.print("Bender2 ");
        method1();
    }

    public String toString() {
        return "We're doomed!";
    }
}
```
Given the classes above, what output is produced by the following code?

```java
Bender[] rodriguez = {new Leela(), new Bender(), new Farnsworth(), new Fry()};
for (int i = 0; i < rodriguez.length; i++) {
    rodriguez[i].method2();
    System.out.println();
    System.out.println(rodriguez[i]);
    rodriguez[i].method1();
    System.out.println();
}
```

Indicate what the output of each of the following statements would be.

<table>
<thead>
<tr>
<th>elements[0]: Leela</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td>elements[1]: Bender</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>elements[2]: Farnsworth</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>elements[3]: Fry</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
3. Linked List Debugging

Consider a method in the LinkedIntList class called `removeFromEnd` that takes an integer as a parameter and removes the \( n \)th node from the end of the list.

For example, suppose the variable `list1` contains the following list:

```java
list1 = [1, 8, 9, 3, 12]
```

After the call `list1.removeFromEnd(2)` executes, the variables `list1` would contain the following list:

```java
list1 = [1, 8, 9, 12]
```

Consider the following buggy implementation of `removeFromEnd`:

```java
public void removeFromEnd(int n) {
    ListNode curr = front;
    for (int i = 0; i < n; i++) {
        curr = curr.next;
    }
    if (curr == null) {
        front = front.next;
    } else {
        ListNode temp = front;
        while (curr != null) {
            curr = curr.next;
            temp = temp.next;
        }
        temp.next = temp.next.next;
    }
}
```

(continued on next page…)

7
This implementation contains a *single* bug that is causing it to not work as intended.

Part A: Identify the single line of code that contains the bug. Write your answer in the box to the right as a single number.

```
8
```

Part B: Annotate (write on) the code below to indicate how you would fix the bug. You may add (using arrows to indicate where to insert), remove (by crossing out), or modify (with a combination) any code you choose. However, the fix should not require a lot of work.

```
1    public void removeFromEnd(int n) {
2        ListNode curr = front;
3        for (int i = 0; i < n; i++) {
4            curr = curr.next;
5        }
6
7        if (curr == null) {
8            front = front.next;
9        } else {
10           ListNode temp = front;
11           while (curr != null) {
12               curr = curr.next;
13               temp = temp.next;
14           }
15           temp.next = temp.next.next;
16        }
17    }
```
4. Inheritance Programming

You have been asked to extend a pre-existing class Student that represents a college student. A student has a name, a year (such as 1 for freshman and 4 for senior), and a set of courses that he/she is taking. The Student class is as follows:

```java
public class Student {
    private String name;
    private int year;
    private Set<String> courses;

    public Student(String name, int year) {
        this.name = name;
        this.year = year;
        this.courses = new HashSet<>();
    }

    public void addCourse(String name) {
        courses.add(name);
    }

    public void dropAll() {
        courses.clear();
    }

    public int getCourseCount() {
        return courses.size();
    }

    public String getName() {
        return name;
    }

    public int getYear() {
        return year;
    }
}
```
You are to define a new class called **GradStudent** that extends Student through inheritance. A **GradStudent** should behave like a Student except for the following differences:

- A grad student keeps track of a research advisor, which is a professor working with the student.
- Grad students are considered to be 4 years further ahead than typical students. So, for example, a grad student in year 1 of grad school is really in year 5 of school overall.
- Grad students can enroll in a maximum of 3 courses at a time. If a grad student tries to add additional courses beyond 3, the course is not added to the student's set of courses.
- If grad students work too much, they become "burnt out." A burnt-out student is one who is in his/her 5th or higher year of grad school (9th or higher year of school overall) or one who is taking 3 courses.

You should provide the same methods as the superclass, as well as the following new behavior.

<table>
<thead>
<tr>
<th>Constructor/Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public GradStudent(String name, int year, String advisor)</td>
<td>Constructs a graduate student with the given name, given year (where 1 is the first year of grad school, 5th year of school overall; etc.), and research advisor</td>
</tr>
<tr>
<td>public String getAdvisor()</td>
<td>Returns this grad student's research advisor</td>
</tr>
<tr>
<td>public boolean isBurntOut()</td>
<td>Returns true if grad student is &quot;burnt out&quot; (in at least the 5th year of grad school, and/or taking 3 courses)</td>
</tr>
</tbody>
</table>
Write your solution to problem #4 here:
5. Recursive Programming

Write a recursive method called `groupChars` that takes a string as a parameter and that returns a new string obtained by inserting parentheses and brackets so as to group the characters. For strings with only one or two characters, the characters should be surrounded by square brackets. For example, `groupChars("in")` should return "[in]" and `groupChars("a")` should return "[a]". For strings with more than 2 characters, parentheses should be inserted that surround and separate individual characters with the center-most characters surrounded by square brackets. The table below includes more examples.

<table>
<thead>
<tr>
<th>Call</th>
<th>Return</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>groupChars(&quot;the&quot;)</code></td>
<td>&quot;(t[h]e)&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;rain&quot;)</code></td>
<td>&quot;(r[a]i)n&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;in&quot;)</code></td>
<td>&quot;[in]&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;Spain&quot;)</code></td>
<td>&quot;(S(p[a]i)n)&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;falls&quot;)</code></td>
<td>&quot;(f(a[l]l)s)&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;mainly&quot;)</code></td>
<td>&quot;(m(a[in]l)y)&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;recursively!&quot;)</code></td>
<td>&quot;(r(e(c(u(r[s]i][v]e)l)y)!)&quot;</td>
</tr>
<tr>
<td><code>groupChars(&quot;&quot;&quot;)</code></td>
<td>&quot;*&quot;</td>
</tr>
</tbody>
</table>

Notice that the method might be passed an empty string, in which case it returns a string composed of a single asterisk. You are not allowed to construct any structured objects other than Strings (no array, List, Scanner, etc.) and you may not use any loops to solve this problem; you must use recursion.
Write your solution to problem #5 here:
6. Binary Tree Programming

Write a method called `add` that takes as a parameter a reference to a second binary tree and that adds the values in the second tree to this tree. If the method is called as follows:

```java
tree1.add(tree2);
```

it should add all values in tree2 to the corresponding nodes in tree1. In other words, the value stored at the root of tree2 should be added to the value stored at the root of tree1 and the values in tree2's left and right subtrees should be added to the corresponding positions in tree1's left and right subtrees. The values in tree2 should not be changed by your method.

If tree1 has a node that has no corresponding node in tree2, then that node is unchanged. For example, if tree2 is empty, tree1 is not changed at all. It is also possible that tree2 will have one or more nodes that have no corresponding node in tree1. For each such node, create a new node in tree1 in the corresponding position with the value stored in tree2's node. For example:
Write your solution to problem #6 here:
