Lecture Outline

- **Announcements** 
- Reference Semantics Review
- Contiguous / Non-Contiguous Memory Review
- ListNode Practice

Announcements

- [Resubmission Cycle 0 open](#), closes today (Jul 11th)
 - Normally resubmissions will be open Mon – Fri each week
- Programming Assignment 0 due tonight, Wed April 16 at 11:59pm!
 - See generic [Programming Assignment rubric](#) posted on website

Lecture Outline

- **Reference Semantics Review** ◀
- Contiguous / Non-Contiguous Memory Review
- ListNode Practice

Reference Semantics

- In Java, variables are treated two different ways:

Value Semantics	Reference Semantics
Primitive types (int, double, boolean) + Strings	Object types (int[], Scanner, ArrayList)
Values stored locally	Values stored in memory, reference stored locally
Initialization copies value (many copies of value)	Initialization copies reference (only one value)

```
int x = 10;  
int y = x;  
  
y++;      // x remains unchanged
```

```
int[] x = new int[5];  
int[] y = x;  
  
y[0]++;   // x[0] changed
```

- We often draw “reference diagrams” to keep track of everything

Reference Semantics

- In Java, variables are treated two different ways:

Value Semantics	Reference Semantics
Primitive types (int, double, boolean) + Strings	Object types (int[], Scanner, ArrayList)
Values stored locally	Values stored in memory, reference stored locally
Initialization copies value (many copies of value)	Initialization copies reference (only one value)

<pre>int x = 10; int y = x; y++; // x remains unchanged</pre>	<pre>int[] x = new int[5]; int[] y = x; y[0]++; // x[0] changed</pre>

Contiguous vs. Non-contiguous: Memory

- Computer memory = one really, *really* big array.

Memory

85	47	-51	44	-38	35	-58	79	27	-14
-24	-38	-66	-27	36	-1	23	20	31	-40
-34	38	37	-52	-15	99	6	68	-67	-58
13	-17	-85	-99	-20	-33	54	38	-66	8
36	24	27	90	-32	72	-73	11	-85	29
-90	-64	29	-27	91	64	28	-97	44	59
-68	76	-1	-6	-52	77	21	37	80	69

Contiguous vs. Non-contiguous: array (1)

- Computer memory = one really, *really* big array.
 - `int[] arr = new int[10];`

Memory

arr

85	47	-51	44	-38	35	-58	79	27	-14
-24	-38	-66	-27	36	-1	23	20	31	-40
-34	38	37	-52	-15	99	6	68	-67	-58
13	-17	-85	-99	-20	-33	54	38	-66	8
36	24	27	90	-32	72	-73	11	-85	29
-90	-64	29	-27	91	64	28	-97	44	59
-68	76	-1	-6	-52	77	21	37	80	69

Contiguous vs. Non-contiguous: array (2)

- Computer memory = one really, *really* big array.
 - `int[] arr = new int[7];`

Memory

The diagram shows a variable 'arr' in a box on the left. A thick black arrow points from the box to the fifth row of a 10x6 table. The fifth row contains the values 36, 24, 27, 90, -32, 72, -73, 11, -85, and 29. The cells containing 0 in the sixth row are highlighted in yellow.

85	47	-51	44	-38	35	-58	79	27	-14
-24	-38	-66	-27	36	-1	23	20	31	-40
-34	38	37	-52	-15	99	6	68	-67	-58
13	-17	-85	-99	-20	-33	54	38	-66	8
36	24	27	90	-32	72	-73	11	-85	29
90	0	0	0	0	0	0	0	44	59
-68	76	-1	-6	-52	77	21	37	80	69

We call this “contiguous” memory

ListNode

- Java class representing a “**node**”
- Two fields to store discussed state:
 - Fields are public?! We’ll come back to this
- Why can `ListNode` be a field in the `ListNode` class?

```
public class ListNode {  
    public int data;  
    public ListNode next;  
}
```

Contiguous vs. Non-contiguous: ListNode (1)

- Computer memory = one really, *really* big array.
 - `ListNode list = new ListNode(1, new ListNode(2));`

Memory

`list`

85	47	-51	44	-38	35	-58	79	27	-14
-24	-38	-1	-27	36	-1	23	20	31	-40
-34	38	37	-52	-15	99	6	68	-67	-58
13	-17	-85	-99	-20	-33	54	38	-66	8
36	24	27	90	-32	72	-73	11	-85	29
-90	-64	29	-27	91	64	28	-97	44	59
-68	76	-1	-6	-52	77	21	37	80	69

Contiguous vs. Non-contiguous: ListNode (2)

- Computer memory = one really, *really* big array.

```
ListNode list = new ListNode(1, new ListNode(2));
```

Memory

Contiguous vs. Non-contiguous: ListNode (3)

- Computer memory = one really, *really* big array.

```
ListNode list = new ListNode(1, new ListNode(2));
```

Memory

Contiguous vs. Non-contiguous: ListNode (4)

- Computer memory = one really, *really* big array.

```
ListNode list = new ListNode(1, new ListNode(2));
```

Memory

Contiguous vs. Non-contiguous: Summary

- Computer memory = one really, *really* big array.
- Contiguous memory = impossible to resize directly
 - Surrounding stuff in memory (we can't just overwrite)
 - Best we can manage is get more space and copy
- Non-contiguous memory = easy to resize
 - Just get some more memory and link it to the rest

- **ListNode Practice** ◀

Linked Nodes

- We want to chain together ints “**non-contiguously**”
- Accomplish this with nodes we link together
 - Each node stores an int (*data*) and an reference to the next node (*next*)

Iterating over ListNodes

- General pattern iteration code will follow:

```
ListNode curr = front;  
while (curr != null) {  
    // Do something  
  
    curr = curr.next;  
}
```
