

CSE 142 Programming I

Style

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-1

The Three Ss of Programming

- Syntax
 - Won't compile without proper syntax
- Semantics
 - Won't do what you want without proper semantics
- Style
 - Won't be able to understand the program without proper style

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-2

What is Style?

- A program is a document
 - Read by the computer
 - Read by people—not always just you!
- Style is a catch-all term for people-oriented programming
 - comments, spacing, indentation, names
 - clear, straightforward, well-organized code

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-3

Why Use Good Style?

- You can read your code, right?
- Can you read it a week/month/year from now?
- Can your TA read it?
 - Can your TA grade it?

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-4

Style in CSE 142

- It is common for employers to have style rules for employees
- These rules are often *very* strict
- We won't be so strict, but we will expect you to follow some general guidelines
- We'll show you style points as we go along, starting today

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-5

/* Comments */

```
/*
*****
Comment block at front of program
* Program:  Mi_To_Km
* Purpose:  Miles to kilometers conversion
* Author:   A. Hacker, 1/18/00 Section AF (Turing)
*****
*/

/* Calculate volume of cylinder and ...
* Inputs:   radius, height, ...
* Output:   volume, ...
* Assumes:  radius, height nonnegative */
.
.
small ones throughout
/* Tell user it's negative. */
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-6

Comments

- Say *why*, not *what*:

- NO:

```
/* subtract one from sheep */  
sheep = sheep - 1;
```

- YES:

```
/* account for the sheep that  
the big bad wolf just ate */  
sheep = sheep - 1;
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-7

Layout Within a Line

- Leave spaces around operators

- NO: `y=slope*x+intercept;`

- YES: `y = slope * x + intercept;`

- Even Better: Use extra parenthesis

- YES: `y = (slope * x) + intercept;`

- Use spaces to vertically align things:

```
int    foo;  
double bar;
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-8

Laying Out Lines

- Use blank lines to separate major sections

- Indent subordinate parts

```
int main(){  
    int a;  
    int b;  
  
    scanf("%d", &a);  
    return 0;  
}
```

Indented

Extra Line

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-9

Identifiers

- Identifiers name variables (and more)

- Letters, digits, and underscores (`_`)

- Cannot begin with a digit

- No reserved words

- Case sensitive

- Don't use all capital letters except for constants (which I'll explain in a moment)

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-10

What's in a Name?

- Identifiers are part of the documentation

- Microsoft Excel has over 65,000 variables.

- How long is just right?

- `c`

- `cheesecakes`

- `numCheesecakes`

- `numberOfCheesecakesThatIAteForBreakfastLastWednesday`

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-11

More on Identifiers

- Avoid similar names

- `mph`, `Mph`, `mqh`

- Keep simple naming conventions

- `firstNumber`

- `first_number`

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-12

Constants

- **Constants** are values that do not change
 - pi is always 3.1459...
 - e is always 2.718281828459045...
- Rather than always typing them, we make names for them using **#define**
- Make these names upper case!

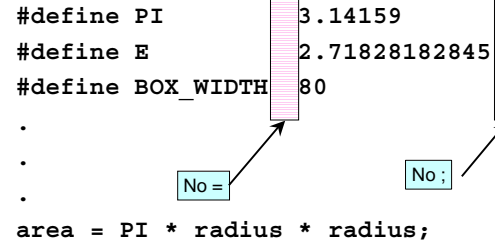

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-13

#define

```
#define PI 3.14159
#define E 2.71828182845
#define BOX_WIDTH 80
.
.
.
area = PI * radius * radius;
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-14

Why Use Constants?

- Centralize changes
- No “**magic numbers**”
- Avoid typing errors
- Avoid accidental assignment to constants

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-15

```
/* Convert miles per hour to feet per second
 * Author: ....
 * Date: ...
 */
#include <stdio.h>
/* conversion constants. */
#define FEET_PER_MILE 5280.0
#define SECONDS_PER_HOUR 3600
int main(void)
{
    double miles_per_hour; /* input mph */
    double feet_per_second; /* corresponding feet/sec */
    double feet_per_hour; /* corresponding feet/hr */
    /* prompt user for input */
    printf("Enter a number of miles per hour: ");
    scanf("%lf", &miles_per_hour);
    /* convert from miles per hour to feet per second */
    feet_per_hour = miles_per_hour * FEET_PER_MILE;
    feet_per_second = feet_per_hour / SECONDS_PER_HOUR;
    /* format and print results */
    printf("%f miles per hour is equal to %f feet per
           "second.\n", miles_per_hour, feet_per_second);
    return(0);
}
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-16

If You Ignore Style...

```
#include<stdio.h>
int main(void){double v1,v2,v3,v4,v5;pr\
intf("Enter a number of miles per hour:\
");scanf("%lf",&v1);v5=v1*14.6666667;pr\
intf("%f miles per hour is equal to %f \
feet per second.\n",v1,v5);return(0);}
```

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-17

Summary: What to Do

- Do
 - Use plenty of comments
 - Use white space
 - Use indentation
 - Choose descriptive names
 - Use named constants
 - Use extra parenthesis
 - Be consistent

28. June, 2000

CSE 142 Summer 2000 — Isaac Kunen

E-18

Summary: What NOT to Do

- Don't
 - Be terse
 - Be tricky
 - Place speed above correctness and simplicity
 - Use magic numbers
