

# CSE 142 Programming I

---

## Arrays

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-1

# The Road Ahead

---

- Read Chapter 8
- Today: Motivation and Introduction—No Code
- Wednesday: Code

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-2

# Motivation

---

- So far we've only used small numbers of variables
  - 3 piles of stones
  - 6 types of food
- We had a name for each value
- What if we had 1000 piles?

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-3

# Motivation: Sorting

---

- What if we had some numbers  
12, 1, 7, 0, -5, 15, 2, 2, 9
- And we wanted to sort them  
-5, 0, 1, 2, 2, 7, 9, 12, 15
- How would we store this now?
- What would the program look like?

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-4

# Motivation: Grades

---

- What if we had 7 grades:
  - `grade1, grade2, ..., grade7`
- How could we average them?  
$$\text{ave} = (\text{grade1} + \text{grade2} + \dots) / 7$$
- What if we had, say, 200 grades?

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-5

# Data Structures

---

- Data structures are ways of organizing data
- Variables are the simplest kind of data structure:
  - They store 1 value
  - Pros? Cons?

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-6

## Arrays

- Arrays let one group together many simpler variables
  - One name
  - Each piece of the array is accessed by a number: the **index**
- In an array, all of the values must have the same type

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-7

## An Array

- Grades for 7 students

0	1.2
1	4.0
2	3.8
3	2.5
4	3.3
5	0.0
6	3.4

array indexes

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-8

## How Do We Average These?

- Use a loop to add them up:

```
sum = 0
for each index
    add the indexed value to sum
```

- When you're done, divide like usual

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-9

## Grades in C

```
double grades[7];
int i;
double sum = 0, average;
...
for (i=0; i<7; i++){
    sum = sum + grades[i];
}
average = sum/7.0;
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-10

## Array Declaration

```
int anArray[100];
```

- "Make an array of 100 integers named anArray."
- Can also use other types.

```
double floatArray[12];
char bunchOChars[1000];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-11

## Array Declarations

- When you declare an array, the size must be an **integer constant!**
- Consider this set of declarations:

```
int size = 5;
double foo[3.0];
char bar[size];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-12

## Accessing Array Elements

- If we have an array `int foo[100]`, then we can access each element using the subscript:

```
foo[3] = 12;

printf("theValue: %d\n", foo[20]);

scanf("%d", &foo[66]);
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-13

## When Can You Use Array Elts.?

- You can use an array element wherever you could use a normal variable of the same type
- If we have an array of doubles, for example, each element is of type double

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-14

## Array Indexes

- Array indexes always begin at 0 in C
- There is no way to change this!
- What are valid indexes in this array?

```
char someCharacters[20];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-15

## Array Bounds

- These array indexes are not checked! This is called **array bounds checking**.
- What happens if you access element 10 in this array?

```
double foo[10];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-16

## Print Above Average Grades

```
double grades[500], total, average, temp;
int students=0, i;

printf("Enter grades, -1 to quit\n");
do{
    scanf("%lf", &temp);
    if (temp >= 0){
        grades[students] = temp;
        students++;
    }
} while (temp >= 0);
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-17

## Print Above Average Grades

```
total = 0;
for (i=0; i<students; i++){
    total = total + grades[i];
}
average = total / students;

for (i=0; i<students; i++){
    if (grades[i] > average) {
        printf("%f\n", grades[i]);
    }
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-18

## Things You Can't Do

---

- You **can't** use = to assign arrays
- You **can't** use == to compare two arrays
- You **can't** scanf or printf an entire array
  
- You can do these things to an array element

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-19

## Parallel Arrays

---

- We can use parallel arrays to keep track of several pieces of information about the same thing

```
int pellets_x[NUM_PELLET];
int pellets_y[NUM_PELLET];
int pellets_type[NUM_PELLET];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-20

## Reflecting Points

---

```
void reflect(int *x, int *y){

    *x = *x * -1;
    *y = *y * -1;

    return;
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-21

## Reflecting Points

---

```
int x_pos[20];
int y_pos[20];
int i;

for (i=0; i<20 ;i++)
    reflect(&x_pos[i], &y_pos[i]);
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-22

## Arrays Unmasked

---

- What happens if we don't subscript an array?
  
- We can think of the array as a pointer to the beginning of a block of storage
  - But you cannot assign to this pointer!

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-23

## Passing Whole Arrays

---

- We can make a function that takes an entire array as a parameter:

```
int sum(int foo[], int size){
    int i, total = 0;
    for (i=0; i<size; i++)
        total = total + foo[i];
    return total;
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-24

## Passing Arrays to Functions

- When we pass an array, we really only copy the pointer
- So, when we change values in the array they **DO** change in the calling function

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-25

## Passing Arrays to Functions

```
void sub1(int foo[], int size){  
  
    int i;  
    for(i=0;i<size;i++){  
        foo[i] = foo[i]-1;  
  
    return;  
}  
  
int main(void){  
    int nums[10], i;  
  
    for(i=0;i<10;i++){  
        nums[i] = i;  
  
    return 0;  
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-26

## Keeping Track of Array Elts.

- We may not use all of the array—how do we keep track of which elements are being used?
  - Keep them all at the beginning of the array, and store a count of how many there are
  - Use a special flag to indicate “in use”

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-27

## Keeping Valid Entries Together

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-28

## In-Use Flag

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-29

## Array Initialization

- When we create an array, none of the elements are initialized!
- We can do initialization in two ways
  - Loop over the array and initialize it
  - Initialize when we declare

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-30

## Loop to Initialize

- Say we want each element initialized to its index value

```
int foo[10], i;
for (i=0; i<10; i++){
    foo[i] = i;
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-31

## Initialization in Declaration

```
int foo[4] = {0, 1, 2, 3};

char vowels[5] = {'a', 'e', 'i',
                 'o', 'u'};

double consts[] = {2.718, 3.14,
                  1.414};
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-32

## These are Illegal

- This isn't a declaration:

```
x = {1.0, 2.0, 3.0};
```

- This doesn't indicate the size:

```
double bar[];
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-33

## Functions and Arrays

- Remember:

- Array elements behave just like normal variables, including as arguments
- Whole arrays behave like output parameters

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-34

## General Vector Sum

```
void vectorSum(int a[], int b[], int
               vsum[], int length){

    int i;
    for (i=0; i<length; i++){
        vsum[i] = a[i] + b[i];
    }
    return;
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-35

## Using the Vector Sum

```
int main(void){
    int v1 = {1, 3, 7};
    int v2 = {2, 4, 8};
    int vsum[3];

    vectorSum(v1, v2, vsum, 3);

    return 0;
}
```

24. July, 2000

CSE 142 Summer 2000 — Isaac Kunen

K1-36
