
CSE 142

Classes and Objects in Java

1/10/2003

(c) 2001-3, University of Washington

E-1

Outline for Today

- Review of objects and classes
- Bank account class design
- Class definitions in Java
- Specifications and Implementations
- Specifying methods in Java

1/10/2003

(c) 2001-3, University of Washington

E-2

Objects Reviewed

- Objects have properties and responsibilities
- Properties
 - Sets of *values*
 - Have a specific *type* (simple or reference to an object type)
 - The current collection of property values is the object's *state*
- Responsibilities
 - The collection of *messages* the object understands – what it can do
 - *Queries* and *commands*

1/10/2003

(c) 2001-3, University of Washington

E-3

Classes Reviewed

- A collection of similar objects is called a *class*
 - All objects in the class have the same properties and responsibilities
- Every object is an *instance* of some class
- The basic unit of programming in Java is a *class definition*
 - Specifies properties and responsibilities of instances
 - Individual objects are created as needed
- Each class defines a new *type*
 - Object properties can be references to other objects

1/10/2003

(c) 2001-3, University of Washington

E-4

Exercise

- Design a class to represent a simple bank account
 - What are the properties?
 - What are the responsibilities?
 - Commands?
 - Queries

1/10/2003

(c) 2001-3, University of Washington

E-5

Bank Account Design (1)

- Properties

1/10/2003

(c) 2001-3, University of Washington

E-6

Bank Account Design (2)

- Responsibilities (commands/queries)

1/10/2003

(c) 2001-3, University of Washington

E-7

Translating this to Java

- Class definition

```
/** Representation of a simple bank account */  
public class BankAccount {  
    ...  
}
```

- Defines a class and gives it a name
- Between the braces { ... } we give details of
 - **Instance variables:** the properties of the object
 - **Methods:** sequences of Java code that carry out the object's responsibilities (commands and queries)
(In other programming languages these are sometimes called functions, procedures, or subroutines)

1/10/2003

(c) 2001-3, University of Washington

E-8

Identifiers – Names of Things

- In the class definition

```
public class BankAccount { ... }
```

BankAccount is the name of the class

- Names in Java are called **identifiers**
 - Combination of letters, digits, underscores (`_`) starting with a letter (`$` is also allowed, but best to avoid)
 - Must start with a letter
 - Case sensitive (`abc`, `Abc`, `ABC` are all different)
 - Details in the book
- May not be a **keyword** or reserved word that has a special meaning in Java
`class`, `public`, `if`, `for`, `int`, `double`, `boolean`, ...

1/10/2003

E-9

Choosing Names

- Picking good names is an essential part of programming
- General rule of thumb: for names that describe classes (types), queries, and properties, use noun phrase that describes instances of the class or the property
 - `accountNumber`, `totalSales`, `quantityInStock`, `getBalance`
 - Avoid cryptic, cute, or vague names
`"value"` or `"count"` contains no useful information
- For methods, use verb phrase that describes action performed
 - `setBalance`, `deposit`, `withdraw`, `changeDate`
- Capitalization – Java convention
 - Instance variables and methods begin with lower case letter
 - Class names capitalized
- A class named `Foo` should be in a file named `Foo.java`

1/10/2003

(c) 2001-3, University of Washington

E-10

Comments

- Used to help the human reader; otherwise ignored
 - Essential to record information needed to understand the program that is not reflected directly in the code (design decisions, strategies, etc.)
- Kinds
 - `//` the rest of the line following `/**` is a comment
 - `/*` everything after `/**` is a comment until reaching this: `*/`
 - `/**` special comment form for documentation ("doc comments") `*/`
- Good commenting is an art
 - Need to include essential information, but don't overdo it

1/10/2003

(c) 2001-3, University of Washington

E-11

Specification vs Implementation

- Specification – view of the class as seen by **client** code that uses instances of the class
 - Often called the interface of the class (although the word interface has a particular technical meaning in Java, which we will get to eventually)
- Implementation – internal details
 - Client should not know anything about this
- Some specifications in real life
 - Automobile "user interface" – steering wheel, pedals, etc.
 - Electric power outlet

1/10/2003

(c) 2001-3, University of Washington

E-12

Specifying a BankAccount

- Class: `BankAccount`
- Queries
 - `getAccountBalance`
 - `getAccountName`
 - `getAccountNumber`
- Commands
 - `setAccountName`
 - `setAccountNumber`
 - `deposit`
 - `withdraw`
- Special “command”: constructor – initialize new `BankAccount` instance when it is created

1/10/2003

(c) 2001-3, University of Washington

E-13

BankAccount Specification in Java

- In Java, the specification and implementation are given in a single file
- To create a class we start by writing the specification parts of methods (i.e., the operations available to client code)
- After specifying, we’ll fill in the implementation details (next lecture)

1/10/2003

(c) 2001-3, University of Washington

E-14

Specifying Methods for Queries

- Example

```
/* return the current balance in this BankAccount */
public double getBalance() { ... }
```
- “public” – defines this as part of the public specification
- “double” (or `int`, `boolean`, `BankAccount`, etc.) – defines the type of the value returned by this query
- “getBalance” – the name of the method; when a `getBalance` message is sent to a `BankAccount` object, this method will be used to carry out that responsibility

1/10/2003

(c) 2001-3, University of Washington

E-15

Specifying Methods for Commands

- Example

```
/* Transfer the given amount from otherAccount to this BankAccount */
public void transfer(double amount, BankAccount otherAccount) { ... }
```
- “public” – same as for a query; this is part of the specification
- “void” – special keyword to identify this as a command that does not return a value
- “deposit” – the name of the method
- “double amount” and “`BankAccount otherAccount`” – these are *parameters*, pieces of information supplied when the object is given this command
Like the 5 in a “clap 5” message sent to an Actor

1/10/2003

(c) 2001-3, University of Washington

E-16

Constructors

- Example

```
/* Construct a new BankAccount */
public BankAccount() { ... }
```
- Like a command, but no “void” keyword
- Every time a new `BankAccount` instance is created, the constructor is used to initialize the new object’s state to some sensible value

1/10/2003

(c) 2001-3, University of Washington

E-17

Summary

- Class Definitions are the unit of programming in Java
- Individual objects are created as instances of these classes
- Specification vs Implementation
 - What is publicly available to client code vs what is private information hidden inside the class
- Specifications for class methods
 - Queries
 - Commands
 - Constructors – a specialized kind of command
