

# Building Java Programs

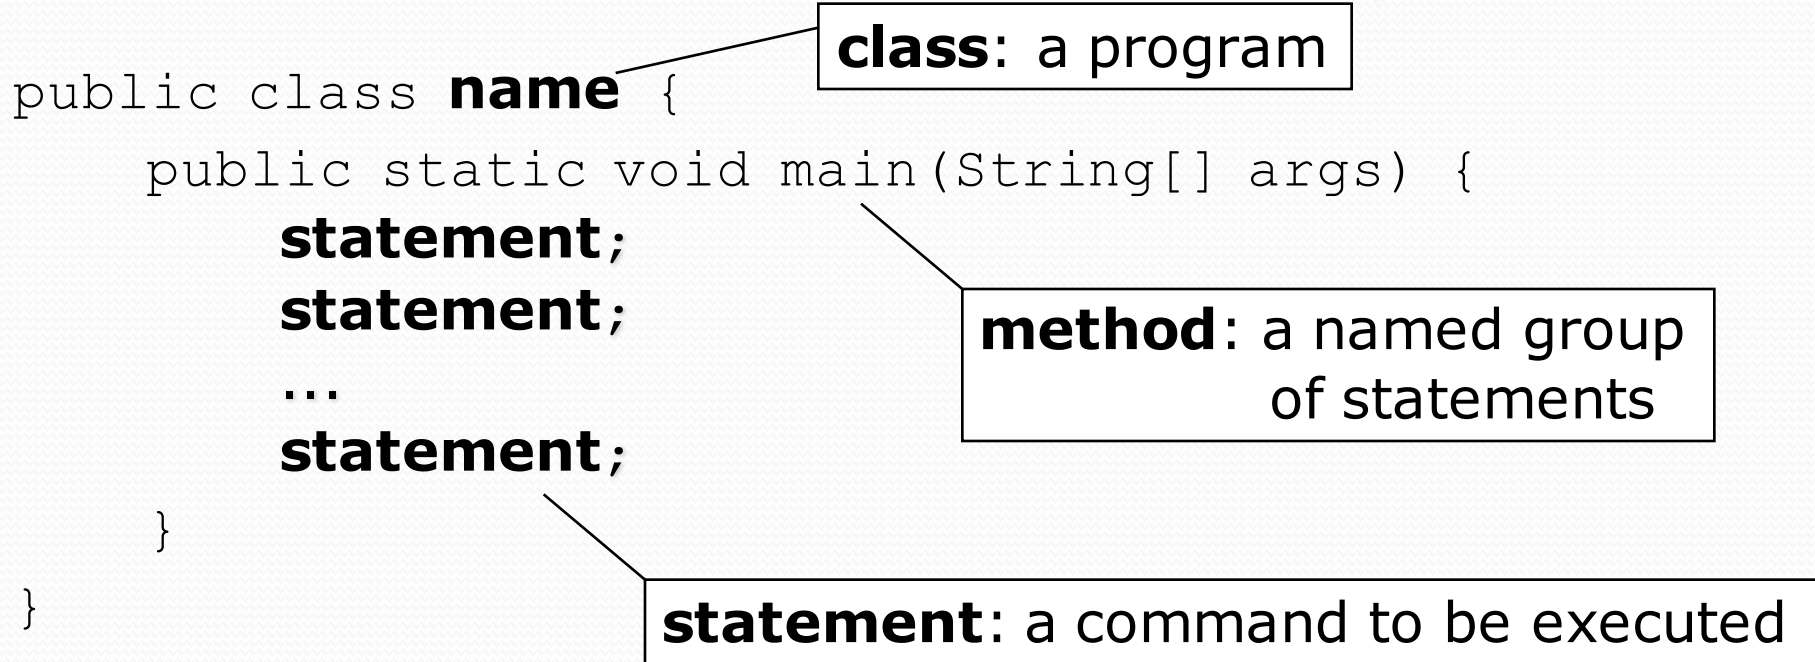

Chapter 1  
Static Methods, Expressions

**reading: 1.4 - 1.5, 2.1**

```
boolean weekday;
int time;
int [] brain;
// Let the wake-up begin!
for (int i=1; i<=numBrainCells; i++) {
    turnOn (brain [i]);
    system.out.println ("Yawn");
}
getCurrTime (time);
isItAWorkday (weekday);
void smile () {
    int [] usualDisArray;
    System.out.println ("Honey, where are you?");
}
// Don't know what to do after this
```

# Recall: structure, syntax

- Every executable Java program consists of a **class**,
  - that contains a **method** named `main`,
    - that contains the **statements** (commands) to be executed.

# Comments

- **comment:** A note written in source code by the programmer to describe or clarify the code.
  - Comments are not executed when your program runs.

- Syntax:

**// comment text, on one line**

or,

**/\* comment text; may span multiple lines \*/**

- Examples:

```
// This is a one-line comment.
```

```
/* This is a very long  
multi-line comment. */
```

# Where to place comments

- At the top of each file (a "comment header") to describe the program.

```
/* Suzy Student, CS 101, Fall 2019  
   This program prints lyrics about Fraggle Rock. */
```

- At the start of every method (seen later) to describe what the method does.

```
// Print the chorus
```

- To explain complex pieces of code

```
// Compute the Mercator map projection
```

# Comments example

```
/* Suzy Student, CS 101, Fall 2019
   This program prints lyrics about Fraggle Rock. */

public class FraggleRock {
    public static void main(String[] args) {
        // first verse
        System.out.println("Dance your cares away");
        System.out.println("Worry's for another day");
        System.out.println();

        // second verse
        System.out.println("Let the music play");
        System.out.println("Down at Fraggle Rock");
    }
}
```

# Why comments?

- Helpful for understanding larger, more complex programs.
- Helps other programmers understand your code.
  - The “other” programmer could be the future you.

# Static methods

**reading: 1.4**

# Algorithms

- **algorithm:** A list of steps for solving a problem.
- Example algorithm: "Bake sugar cookies"
  - Mix the dry ingredients.
  - Cream the butter and sugar.
  - Beat in the eggs.
  - Stir in the dry ingredients.
  - Set the oven temperature.
  - Set the timer for 10 minutes.
  - Place the cookies into the oven.
  - Allow the cookies to bake.
  - Mix ingredients for frosting.
  - ...

# Problems with algorithms

- *lack of structure*: Many steps; tough to follow.
- *redundancy*: Consider making a double batch...
  - Mix the dry ingredients.
  - Cream the butter and sugar.
  - Beat in the eggs.
  - Stir in the dry ingredients.
  - Set the oven temperature.
  - Set the timer for 10 minutes.
  - Place the first batch of cookies into the oven.
  - Allow the cookies to bake.
  - Set the timer for 10 minutes.
  - Place the second batch of cookies into the oven.
  - Allow the cookies to bake.
  - Mix ingredients for frosting.
  - ...

# Structured algorithms

- **structured algorithm:** Split into coherent tasks.

- 1 Make the batter.**

- Mix the dry ingredients.
    - Cream the butter and sugar.
    - Beat in the eggs.
    - Stir in the dry ingredients.

- 2 Bake the cookies.**

- Set the oven temperature.
    - Set the timer for 10 minutes.
    - Place the cookies into the oven.
    - Allow the cookies to bake.

- 3 Decorate the cookies.**

- Mix the ingredients for the frosting.
    - Spread frosting and sprinkles onto the cookies.

...

# Removing redundancy

- A well-structured algorithm can describe repeated tasks with less redundancy.

## **1** Make the batter.

- Mix the dry ingredients.
- ...

## **2a** Bake the cookies (first batch).

- Set the oven temperature.
- Set the timer for 10 minutes.
- ...

## **2b** Bake the cookies (second batch).

- Repeat Step 2a

## **3** Decorate the cookies.

- ...

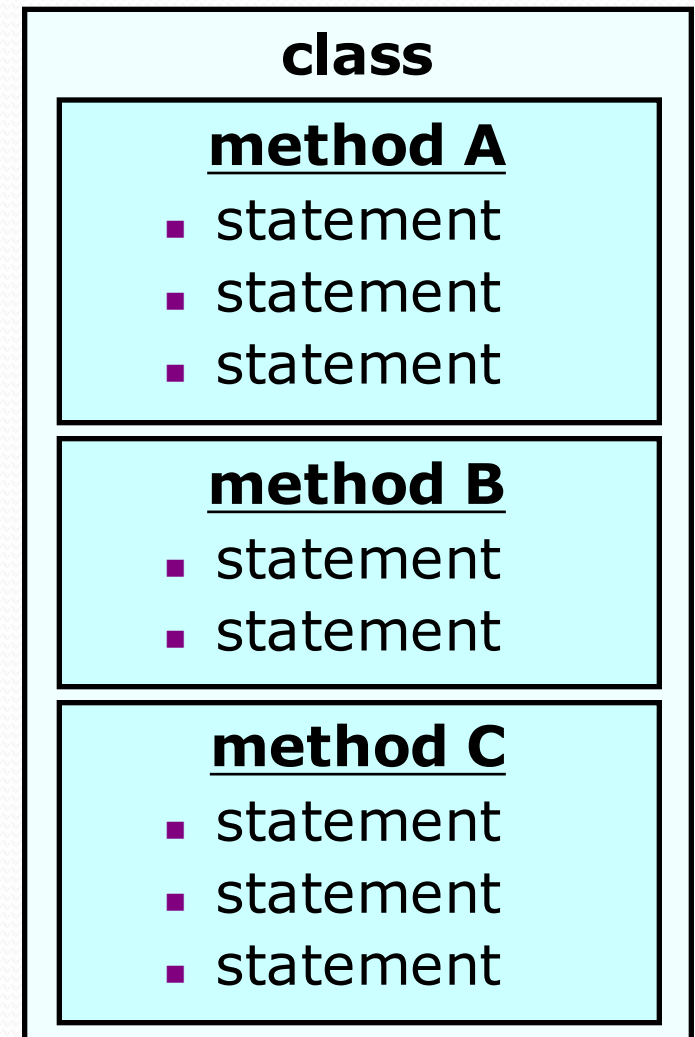

# A program with redundancy

```
// This program displays a delicious recipe for baking cookies.
```

```
public class BakeCookies {  
    public static void main(String[] args) {  
        System.out.println("Mix the dry ingredients.");  
        System.out.println("Cream the butter and sugar.");  
        System.out.println("Beat in the eggs.");  
        System.out.println("Stir in the dry ingredients.");  
        System.out.println("Set the oven temperature.");  
        System.out.println("Set the timer for 10 minutes.");  
        System.out.println("Place a batch of cookies into the oven.");  
        System.out.println("Allow the cookies to bake.");  
        System.out.println("Set the oven temperature.");  
        System.out.println("Set the timer for 10 minutes.");  
        System.out.println("Place a batch of cookies into the oven.");  
        System.out.println("Allow the cookies to bake.");  
        System.out.println("Mix ingredients for frosting.");  
        System.out.println("Spread frosting and sprinkles.");  
    }  
}
```

# Static methods

- **static method:** A named group of statements.
  - denotes the *structure* of a program
  - eliminates *redundancy* by code reuse
- Writing a static method is like adding a new command to Java.
- **procedural decomposition:** dividing a problem into methods

# Using static methods

1. **Design** (think about) the algorithm.
  - Look at the structure, and which commands are repeated.
  - Decide what are the important overall tasks.
2. **Declare** (write down) the methods.
  - Arrange statements into groups and give each group a name.
3. **Call** (run) the methods.
  - The program's `main` method executes the other methods to perform the overall task.

# Design of an algorithm

```
// This program displays a delicious recipe for baking cookies.
public class BakeCookies2 {
    public static void main(String[] args) {
        // Step 1: Make the cake batter.
        System.out.println("Mix the dry ingredients.");
        System.out.println("Cream the butter and sugar.");
        System.out.println("Beat in the eggs.");
        System.out.println("Stir in the dry ingredients.");

        // Step 2a: Bake cookies (first batch).
        System.out.println("Set the oven temperature.");
        System.out.println("Set the timer for 10 minutes.");
        System.out.println("Place a batch of cookies into the oven.");
        System.out.println("Allow the cookies to bake.");

        // Step 2b: Bake cookies (second batch).
        System.out.println("Set the oven temperature.");
        System.out.println("Set the timer for 10 minutes.");
        System.out.println("Place a batch of cookies into the oven.");
        System.out.println("Allow the cookies to bake.");

        // Step 3: Decorate the cookies.
        System.out.println("Mix ingredients for frosting.");
        System.out.println("Spread frosting and sprinkles.");
    }
}
```

# Declaring a method

*Gives your method a name so it can be executed*

- Syntax:

```
public static void name() {  
    statement;  
    statement;  
    ...  
    statement;  
}
```

- Example:

```
public static void printWarning() {  
    System.out.println("This product causes cancer");  
    System.out.println("in lab rats and humans.");  
}
```

# Calling a method

*Executes the method's code*

- Syntax:

**name** ();

- You can call the same method many times if you like.

- Example:

```
printWarning();
```

- Output:

```
This product causes cancer  
in lab rats and humans.
```

# Program with static method

```
public class FreshPrince {
    public static void main(String[] args) {
        rap();           // Calling (running) the rap method
        System.out.println();
        rap();           // Calling the rap method again
    }

    // This method prints the lyrics to my favorite song.
    public static void rap() {
        System.out.println("Now this is the story all about how");
        System.out.println("My life got flipped turned upside-down");
    }
}
```

## Output:

```
Now this is the story all about how
My life got flipped turned upside-down
```

```
Now this is the story all about how
My life got flipped turned upside-down
```

# Final cookie program

```
// This program displays a delicious recipe for baking cookies.
public class BakeCookies3 {
    public static void main(String[] args) {
        makeBatter();
        bake();           // 1st batch
        bake();           // 2nd batch
        decorate();
    }

    // Step 1: Make the cake batter.
    public static void makeBatter() {
        System.out.println("Mix the dry ingredients.");
        System.out.println("Cream the butter and sugar.");
        System.out.println("Beat in the eggs.");
        System.out.println("Stir in the dry ingredients.");
    }

    // Step 2: Bake a batch of cookies.
    public static void bake() {
        System.out.println("Set the oven temperature.");
        System.out.println("Set the timer for 10 minutes.");
        System.out.println("Place a batch of cookies into the oven.");
        System.out.println("Allow the cookies to bake.");
    }

    // Step 3: Decorate the cookies.
    public static void decorate() {
        System.out.println("Mix ingredients for frosting.");
        System.out.println("Spread frosting and sprinkles.");
    }
}
```

# Summary: Why methods?

- Makes code easier to read by capturing the structure of the program
  - `main` should be a good summary of the program

```
public static void main(String[] args) {  
    [redacted]  
    [redacted]  
    [redacted]  
}
```

**Note:** Longer code doesn't necessarily mean worse code

```
public static void main(String[] args) {  
    [redacted]  
    [redacted]  
    [redacted]  
}  
  
public static ... [redacted] (...) {  
    [redacted]  
}  
  
public static ... [redacted] (...) {  
    [redacted]  
}
```

# Summary: Why methods?

- Eliminate redundancy

```
public static void main(String[] args) {
```

```
}
```

```
public static void main(String[] args) {
```

```
}
```

```
public static ... (args) {
```

```
}
```

# Methods calling methods

```
public class MethodsExample {
    public static void main(String[] args) {
        message1();
        message2();
        System.out.println("Done with main.");
    }

    public static void message1() {
        System.out.println("This is message1.");
    }

    public static void message2() {
        System.out.println("This is message2.");
        message1();
        System.out.println("Done with message2.");
    }
}
```

- **Output:**

```
This is message1.
This is message2.
This is message1.
Done with message2.
Done with main.
```

# Control flow

- When a method is called, the program's execution...
  - "jumps" into that method, executing its statements, then
  - "jumps" back to the point where the method was called.

```
public class MethodsExample {  
    public static void main(String[] args) {  
        message1 () ;  
        message2 () ;  
        System.out.println("...")  
    }  
    ...  
}
```

```
public static void message1() {  
    System.out.println("This is message1.");  
}
```

```
public static void message2() {  
    System.out.println("This is message2.");  
    message1 () ;  
    System.out.println("Done with  
message2.");  
}
```

```
public static void message1() {  
    System.out.println("This is message1.");  
}
```

# When to use methods

- Place statements into a static method if:
  - The statements are related structurally, and/or
  - The statements are repeated.
- You should **not** create static methods for:
  - An individual `println` statement that appears once in a program.
  - Only blank lines.
  - Unrelated or weakly related statements.  
(Consider splitting them into two smaller methods.)

# A word about style

- Structure your code properly
- Eliminate redundant code
- Use spaces judiciously and **consistently**
- Indent properly
- Follow the naming conventions
- Use comments to describe behavior of your program and each method

# Why style?

- Programmers build on top of other's code all the time.
  - You shouldn't waste time deciphering what a method does.
  - Often times, that other person is **you**
- You should spend time on thinking or coding. You should **NOT** be wasting time looking for that missing closing brace.

# Why style?

Taylor Swift has a song about it

# Drawing complex figures with static methods

**reading: 1.5**  
(Ch. 1 Case Study: `DrawFigures`)

# Static methods question

- Write a program to print these figures using methods.

# Development strategy

## First version (unstructured):

- Create an empty program and `main` method.
- Copy the expected output into it, surrounding each line with `System.out.println` syntax.
- Run it to verify the output.

# Program version 1

```
public class Figures1 {
    public static void main(String[] args) {
        System.out.println(" ");
        System.out.println(" /_____\\");
        System.out.println("/           \\");
        System.out.println("\\           /");
        System.out.println(" \\_____ /");
        System.out.println();
        System.out.println("\\           /");
        System.out.println(" \\_____ /");
        System.out.println("+-----+");
        System.out.println();
        System.out.println(" ");
        System.out.println(" /_____\\");
        System.out.println("/           \\");
        System.out.println("|   STOP   |");
        System.out.println("\\           /");
        System.out.println(" \\_____ /");
        System.out.println();
        System.out.println(" ");
        System.out.println(" /_____\\");
        System.out.println("/           \\");
        System.out.println("+-----+");
    }
}
```

# Development strategy 2

Second version (structured, with redundancy):

- Identify the structure of the output.
- Divide the `main` method into static methods based on this structure.

# Output structure

The structure of the output:

- initial "egg" figure
- second "teacup" figure
- third "stop sign" figure
- fourth "hat" figure

This structure can be represented by methods:

- egg
- teaCup
- stopSign
- hat

# Program version 2

```
public class Figures2 {
    public static void main(String[] args) {
        egg();
        teaCup();
        stopSign();
        hat();
    }

    public static void egg() {
        System.out.println("          ");
        System.out.println(" /_____\\");
        System.out.println("/           \\");
        System.out.println("\\         /");
        System.out.println(" \\_____ /");
        System.out.println();
    }

    public static void teaCup() {
        System.out.println("\\         /");
        System.out.println(" \\_____ /");
        System.out.println("+-----+");
        System.out.println();
    }
    ...
}
```

# Program version 2, cont'd.

...

```
public static void stopSign() {
    System.out.println("      ");
    System.out.println(" /-----\\");
    System.out.println("/           \\");
    System.out.println("|   STOP   |");
    System.out.println("\\           /");
    System.out.println(" \\-----/");
    System.out.println();
}
```

```
public static void hat() {
    System.out.println("      ");
    System.out.println(" /-----\\");
    System.out.println("/           \\");
    System.out.println("+-----+");
}
```

```
}
```

# Development strategy 3

Third version (structured, without redundancy):

- Identify redundancy in the output, and create methods to eliminate as much as possible.
- Add comments to the program.

# Output redundancy

The redundancy in the output:

- egg top: reused on stop sign, hat
- egg bottom: reused on teacup, stop sign
- divider line: used on teacup, hat

This redundancy can be fixed by methods:

- `eggTop`
- `eggBottom`
- `line`

# Program version 3

```
// Suzy Student, CSE 138, Spring 2094
// Prints several figures, with methods for structure and redundancy.
public class Figures3 {
    public static void main(String[] args) {
        egg();
        teaCup();
        stopSign();
        hat();
    }

    // Draws the top half of an an egg figure.
    public static void eggTop() {
        System.out.println("      ");
        System.out.println(" /-----\\");
        System.out.println("/           \\");
    }

    // Draws the bottom half of an egg figure.
    public static void eggBottom() {
        System.out.println("\\           /");
        System.out.println("\\-----/");
    }

    // Draws a complete egg figure.
    public static void egg() {
        eggTop();
        eggBottom();
        System.out.println();
    }

    ...
}
```

# Program version 3, cont'd.

```
...
// Draws a teacup figure.
public static void teaCup() {
    eggBottom();
    line();
    System.out.println();
}

// Draws a stop sign figure.
public static void stopSign() {
    eggTop();
    System.out.println("|   STOP   |");
    eggBottom();
    System.out.println();
}

// Draws a figure that looks sort of like a hat.
public static void hat() {
    eggTop();
    line();
}

// Draws a line of dashes.
public static void line() {
    System.out.println("+-----+");
}
}
```

# Data and expressions

**reading: 2.1**

# The computer's view

- Internally, computers store everything as 1's and 0's

104 → 01101000

"hi" → 0110100001101001

h → 01101000

- How can the computer tell the difference between an `h` and `104`?
- **type**: A category or set of data values.
  - Constrains the operations that can be performed on data
  - Many languages ask the programmer to specify types
  - Examples: integer, real number, string

# Java's primitive types

- **primitive types**: 8 simple types for numbers, text, etc.
  - Java also has **object types**, which we'll talk about later

<b>Name</b>	<b>Description</b>	<b>Examples</b>
<code>int</code>	integers (up to $2^{31} - 1$ )	<code>42, -3, 0, 926394</code>
<code>double</code>	real numbers (up to $10^{308}$ )	<code>3.1, -0.25, 9.4e3</code>
<code>char</code>	single text characters	<code>'a', 'X', '?', '\n'</code>
<code>boolean</code>	logical values	<code>true, false</code>

- Why does Java distinguish integers vs. real numbers?

# Integer or real number?

- Which category is more appropriate?

integer ( <code>int</code> )	real number ( <code>double</code> )

1. Temperature in degrees Celsius
2. The population of lemmings
3. Your grade point average
4. A person's age in years
5. A person's weight in pounds
6. A person's height in meters
7. Number of miles traveled
8. Number of dry days in the past month
9. Your locker number
10. Number of seconds left in a game
11. The sum of a group of integers
12. The average of a group of integers

- credit: Kate Deibel

# Expressions

- **expression:** A value or operation that computes a value.

- Examples:  
 $1 + 4 * 5$   
 $(7 + 2) * 6 / 3$   
42  
`"Hello, world!"`

- The simplest expression is a *literal value*.
- A complex expression can use operators and parentheses.

# Arithmetic operators

- **operator:** Combines multiple values or expressions.

+	addition
-	subtraction (or negation)
*	multiplication
/	division
%	modulus (a.k.a. remainder)

- As a program runs, its expressions are *evaluated*.
  - `1 + 1` evaluates to `2`
  - `System.out.println(3 * 4);` prints `12`
    - How would we print the text `3 * 4` ?

# Integer division with /

- When we divide integers, the quotient is also an integer.
  - $14 / 4$  is 3, not 3.5

$$\begin{array}{r} \underline{\quad 3} \\ 4 \ ) \ 14 \\ \underline{12} \\ 2 \end{array}$$

$$\begin{array}{r} \underline{\quad 4} \\ 10 \ ) \ 45 \\ \underline{40} \\ 5 \end{array}$$

$$\begin{array}{r} \underline{\quad 52} \\ 27 \ ) \ 1425 \\ \underline{135} \\ 75 \\ \underline{54} \\ 21 \end{array}$$

- More examples:

- $32 / 5$  is 6
- $84 / 10$  is 8
- $156 / 100$  is 1

- Dividing by 0 causes an error when your program runs.

# Integer remainder with %

- The % operator computes the remainder from integer division.

- $14 \% 4$  is 2

- $218 \% 5$  is 3

$$\begin{array}{r} 3 \\ \hline 4 \ ) \ 14 \\ \underline{12} \\ 2 \end{array}$$

$$\begin{array}{r} 43 \\ \hline 5 \ ) \ 218 \\ \underline{20} \\ 18 \\ \underline{15} \\ 3 \end{array}$$

What is the result?

$$45 \% 6$$

$$2 \% 2$$

$$8 \% 20$$

$$11 \% 0$$

- Applications of % operator:

- Obtain last digit of a number:  $230857 \% 10$  is 7

- Obtain last 4 digits:  $658236489 \% 10000$  is 6489

- See whether a number is odd:  $7 \% 2$  is 1,  $42 \% 2$  is 0

# Remember PEMDAS?

- **precedence:** Order in which operators are evaluated.

- Generally operators evaluate left-to-right.

$1 - 2 - 3$  is  $(1 - 2) - 3$  which is  $-4$

- But  $*$  /  $\%$  have a higher level of precedence than  $+$  -

$1 + 3 * 4$  is 13

$6 + 8 / 2 * 3$

$6 + 4 * 3$

$6 + 12$  is 18

- Parentheses can force a certain order of evaluation:

$(1 + 3) * 4$  is 16

- Spacing does not affect order of evaluation

$1+3 * 4-2$  is 11

# Precedence questions

- What values result from the following expressions?
  - $9 / 5$
  - $695 \% 20$
  - $7 + 6 * 5$
  - $7 * 6 + 5$
  - $248 \% 100 / 5$
  - $6 * 3 - 9 / 4$
  - $(5 - 7) * 4$
  - $6 + (18 \% (17 - 12))$

# Precedence examples

1 \* 2 + 3 \* 5 % 4

1 + 8 / 3 \* 2 - 9

# Real numbers (type double)

- Examples: `6.022` , `-42.0` , `2.143e17`
  - Placing `.0` or `.` after an integer makes it a `double`.
- The operators `+` `-` `*` `/` `%` `()` all still work with `double`.
  - `/` produces an exact answer: `15.0 / 2.0` is `7.5`
  - Precedence is the same: `()` before `*` `/` `%` before `+` `-`

# Precision in real numbers

- The computer internally represents real numbers in an imprecise way.

- **Example:**

```
System.out.println(0.1 + 0.2);
```

- The output is 0.30000000000000004!

# Real number example

$$2.0 * 2.4 + 2.25 * 4.0 / 2.0$$

**4.8**

$$+ 2.25 * 4.0 / 2.0$$

**9.0**

4.8

$$+ \quad \quad \quad / 2.0$$

**4.5**

4.8

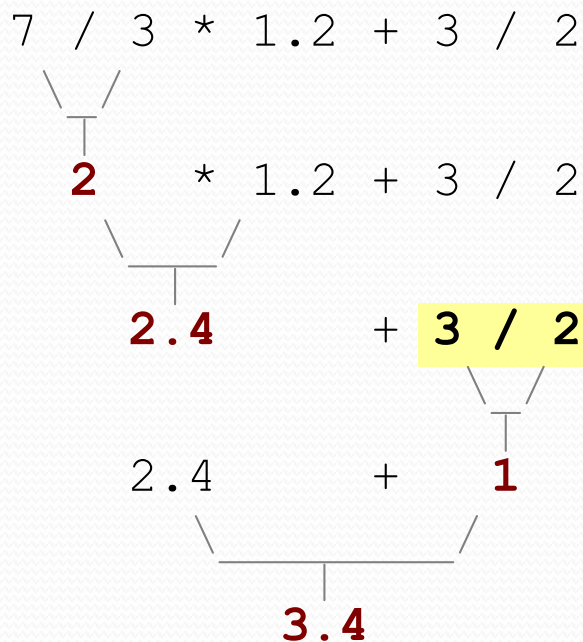

+

**9.3**

# Mixing types

- When `int` and `double` are mixed, the result is a double.
  - `4.2 * 3` is `12.6`
- The conversion is per-operator, affecting only its operands.

- `3 / 2` is `1` above, not `1.5`.

# String concatenation

- **string concatenation:** Using + between a string and another value to make a longer string.

```
"hello" + 42      is "hello42"  
1 + "abc" + 2    is "1abc2"  
"abc" + 1 + 2    is "abc12"  
1 + 2 + "abc"    is "3abc"  
"abc" + 9 * 3    is "abc27"  
"1" + 1          is "11"  
4 - 1 + "abc"    is "3abc"
```

- Use + to print a string and an expression's value together.
  - `System.out.println("Grade: " + (95.1 + 71.9) / 2);`
  - **Output:** Grade: 83.5
