

CSE142 Lecture Questions for Monday, 2/8/21, section B

Time (e.g., 12:45)	Question	Answer
39:00	For printing results, is grammar checked. For example, if its printing a count of 1 or more than 1. Okay. Thank you :)	Any problem on an exam will tell you exactly what to do. If it doesn't mention anything about being grammatically correct, then you don't have to worry about it.
45:30	For the result string, I tried [result = result + ch * 2; Why does this return int values instead of string?] Got it.	There is no notion of multiplying a character or string by 2 in Java. Python does that, but not Java. In Java, it sees ch * 2 and it figures you must want the int value of ch to be multiplied by 2.
0:00	I have a non-lecture question - how does practice-it compare our output if we are using the Random class? So it's not completely random?	You can control what values are generated by a Random object by constructing it with a specific seed value.
