## Arithmetic Expressions

© 1999 UW CSE

9/30/99

C-1

## Assignment Statement Review

```
double area, radius;
```

```
area = 3.14 * radius * radius;
```

assignment statement

expression

9/30/99

C-2

## Expressions

- Expressions are things that have **values**
  - A **variable by itself** is an expression: **radius**
  - A **constant by itself** is an expression: **3.14**
- Often expressions are **combinations** of variables, constants, and operators.  

```
area = 3.14 * radius * radius;
```
- The overall value of the expression is based on the data and operators specified.
  - Data** means the integer or floating-point constants and/or variables in the expression.
  - Operators** are things like addition, multiplication, etc.

9/30/99

C-3

## The Big Picture

- In an assignment statement,
  - the expression (right hand side) is first **evaluated**,
  - then its value is **assigned to** (stored in) the **assignment variable** (left hand side).
- How this happens depends on the data **types** in the expression, the **operators**, and the **type** of the assignment variable.

```
my_int = int1 + int2;
```

int1  my\_int

int2

9/30/99

C-4

## Unary and Binary

- Binary**: operates on **two** things  

```
3.0 * b
```

```
zebra + giraffe
```
- Unary**: operates on **one** thing  

```
-23.4
```
- C operators are unary or binary
- Then what about expressions like 

```
a+b+c?
```

9/30/99

C-5

## Expressions with *doubles*

### REVIEW:

*Doubles are floating-point values that represent real numbers within the computer.*

Constants of type double:

0.0, 3.14, -2.1, 5.0, 6.02e23, 1.0e-3

**not** 0 or 17

Operators on doubles:

unary: -

binary: +, -, \*, /

9/30/99

C-6

## Expressions with *doubles*: Examples

*double* height, base, radius, x, c1, c2 ;

Sample expressions (not statements):

$0.5 * \text{height} * \text{base}$

$(4.0 / 3.0) * 3.14 * \text{radius} * \text{radius} * \text{radius}$

$- 3.0 + c1 * x - c2 * x * x$

9/30/99

C-7

## Expressions with *ints*

REVIEW:

An *integer* represents a whole number with no fractional part.

Constants of type *int*:

0, 1, -17, 42      not 0.0 or 1e3

Operators on *ints*:

unary: -

binary: +, -, \*, /, %

9/30/99

C-8

## *int* division and remainder

Integer operators include *integer division* and *integer remainder*.

$$\begin{array}{r} 2 \\ 100 \overline{)299} \\ \underline{200} \phantom{0} \\ 99 \end{array}$$

/ is *integer division*: no remainder, no rounding

$299 / 100 \rightarrow 2$ ,  $6 / 4 \rightarrow 1$ ,  $5 / 6 \rightarrow 0$

% is *mod* or *remainder*:

$299 \% 100 \rightarrow 99$ ,  $6 \% 4 \rightarrow 2$ ,  $5 \% 6 \rightarrow 5$

9/30/99

C-9

## Expressions with *ints*: Examples

Given: total\_minutes      359

Find: hours      5  
minutes      59

Solution:

hours = total\_minutes / 60 ;

minutes = total\_minutes % 60 ;

9/30/99

C-10

## A Cautionary Example

*int* radius;

*double* area;

•

•

•

area = ( 22 / 7 ) \* radius \* radius;

9/30/99

C-11

## Why Use *ints*? Why Not *doubles* Always?

- Sometimes only *ints* make sense
  - "give me the 15<sup>th</sup> spreadsheet cell"
  - "give me the (14.9999998387)<sup>th</sup> cell" ??
- *Doubles* may be inaccurate representing "ints"
  - In mathematics  $3 * 15 * (1/3) = 15$
  - In computer arithmetic  $3.0 * 15.0 * (1.0 / 3.0)$  might be 14.999999997
- Last, *and least*
  - arithmetic with *doubles* is often slower
  - *doubles* often require more memory

9/30/99

C-12

## Operator Precedence

**Precedence** determines the order of evaluation of operators.

Is  $a + b * a - b$  equal to  $(a + b) * (a - b)$  or  $a + (b * a) - b$  ??

And does it matter?

Try this:

$4 + 3 * 2 - 1$

$(4 + 3) * (2 - 1) =$

$4 + (3 * 2) - 1 =$

9/30/99

C-13

## Operator Precedence

Precedence rules:

1. do  $()$ 's first, starting with innermost
2. then do unary minus (negation):  $-$
3. then do multiplicative ops:  $*$ ,  $/$ ,  $\%$
4. lastly do additive ops: binary  $+$ ,  $-$

9/30/99

C-14

## Associativity

**Associativity** determines the order among consecutive operators of equal precedence

Is  $a / b * c$  equal to  $a / (b * c)$  or  $(a / b) * c$  ??

Most C arithmetic operators are "**left associative**", **within** the same precedence level

$a / b * c$  equals  $(a / b) * c$

$a + b - c + d$  equals  $((a + b) - c) + d$

C also has a few operators that are right associative.

9/30/99

C-15

## The Full Story...

- C has about 50 operators & 18 precedence levels...
- A "Precedence Table" shows all the operators, their precedence and associativity.
  - Look on inside front cover of our textbook
  - Look in any C reference manual
- When in doubt: check the table
- When faced with an unknown operator: check the table

9/30/99

C-16

## Precedence and Associativity: Example

Mathematical formula:

$$\frac{-b + \sqrt{b^2 - 4ac}}{2a}$$

C formula:

$(-b + \text{sqrt}(b * b - 4.0 * a * c)) / (2.0 * a)$

9/30/99

C-17

## Expressions & Values

9/30/99

C-18

## Mixed Type Expressions

What is  $2 * 3.14$  ?

Compiler will implicitly (automatically) convert *int* to *double* **when they occur together**:

*int* + *double* → *double* + *double* (likewise -, \*, /)

$2 * 3.14 \rightarrow (2 * 3) * 3.14 \rightarrow 6 * 3.14 \rightarrow 6.0 * 3.14 \rightarrow 18.84$

$2 / 3 * 3.14 \rightarrow (2 / 3) * 3.14 \rightarrow 0 * 3.14 \rightarrow 0.0 * 3.14 \rightarrow 0.0$

We **strongly** recommend you avoid mixed types:  
e.g., use  $2.0 / 3.0 * 3.14$  instead.

9/30/99

C-19

## Conversions in Assignments

```
int total, count ;
double avg;
total = 97 ; count = 10 ;
```

implicit conversion to double  
 $avg = total / count ;$  /\*avg is 9.0\*/  
 $total = avg ;$  /\*BAD\*/

9/30/99

C-20

## Explicit Conversions

(Section 7.1)

- To be explicit in the program, you can use a **cast**
  - convert the result of an expression to a different type.
- Format: *(type) expression*
- Examples:
  - (double) myage*
  - (int) (balance + deposit)*
- This does not change the rules for evaluating the expression (types, etc.)

9/30/99

C-21

## Using Casts

```
int total, count ;
double avg;
total = 97 ; count = 10 ;
```

implicit conversion to double  
 $avg = total / count ;$  /\*avg is 9.0\*/  
 $avg = (double) total / (double) count ;$  /\*avg is 9.7\*/  
explicit conversion to double  
 $avg = (double) (total / count) ;$  /\*avg is 9.0\*/

9/30/99

C-22

## C is "Strongly Typed"

- Every value has a type
- C cares a lot about what the type of each thing is
- Lots of cases where types have to match up
- Start now: be constantly aware of the type of everything in your programs!

9/30/99

C-23

## Basic Lessons

- Write in the **clearest** way possible for the reader.
- Keep it **simple**; for very complex expressions, break them up into multiple statements.
- Use **parentheses** to indicate your desired precedence for operators where it may be ambiguous.
- Use explicit **casts** to avoid implicit conversions in mixed mode expressions and assignments.
- Be aware of types.
