

CSE 143

Abstract Data Types

[Chapter 3]

3/25/2001 D-1

Data Abstraction

What is *Abstraction*?

- An idealization
- A focus on essential qualities, disregarding the “details”
- An emphasis on the *what* rather than the *how*
Specification vs. Implementation
- A problem-solving technique

3/25/2001 D-2

Abstraction in Programming

- The type `int` is an abstraction for a way of interpreting bits in memory as a number
- A *struct* is an abstraction of a collection of related data items
- A *function* is a programmer-designed abstraction for some computation
- A *module* is a programmer-designed abstraction that groups related functions and data together and provides an interface

3/25/2001 D-3

Why Abstraction?

- Abstractions helps in managing complexity
 - Don't need to know details, just interface
- Treat abstractions as “black box” components to build upon
 - Know what inputs go into box, and what outputs come out, but not what goes on inside the box
 - Hierarchical or layered decomposition

3/25/2001 D-4

Review: **Types** vs. **Instances**

- **Types**
 - General category
 - Usually few in number
 - Some built in (`int`, `char`, `double`, etc.)
 - Programmer-defined (`arrays`, `structs`, `enums`, `classes`, etc.)
- **Instances**
 - Particular variables, parameters, etc.
 - May have many instances of a given type

3/25/2001 D-5

Abstract Data Types

- ADTs have two aspects:
 - Collection of *data*
 - *Operations* that can be applied to data
- Examples
 - Integers: arithmetic operations, printing, etc.
 - Boolean: AND, OR, NOT, test if `true`, etc.
 - Grade Transcript: Add, remove classes and grades, change grades, etc.

3/25/2001 D-6

Type = Data + Operations

- More Examples:

- Automatic Teller Machine

- Data: cash available, machine status
 - Operations: get account information, dispense cash, confiscate card, ...

- Telephone network switch

- Data: line status, call information
 - Operations: set up and break down calls, send billing information, test circuits, ...

3/25/2001 D-7

Abstract Data Types

Two separate aspects:

- **Interface**

- Name of new type
 - "Constructors" to make instances
 - Public operations on instances

- **Implementation**

- Data representation of new type
 - Implementation of public operations, constructors
 - Additional private operations

3/25/2001 D-8

Implementer / Client / User

- Implementer (programmer)

- writes the internal details of some part of the system
 - defines interface and implementation

- Client (programmer)

- uses the interface of the "black box" provided by the Implementer
 - does not (directly) use the implementation!

- User (non-programmer)

- sees only the exterior behavior of the system
 - Related language for functions: Caller vs. called

3/25/2001 D-9

Textbook example: List ADT

- A list... names, groceries, numbers, etc.

- What do you need to do?

- Create and destroy a list
 - Find out how long it is
 - Add (insert) new items to it
 - Delete items
 - Look at (retrieve) items

- Vector

- A list where you can retrieve values by their index

3/25/2001 D-10

Bank Accounts (Another ADT Example)

- Data

- Owner Name
 - Owner SSN
 - Balance
 - Transaction history
 - ...

**Client
Program**

- Operations

- Create
 - Deposit
 - Withdraw
 - Balance Inquiry
 - ...

3/25/2001 D-11

Bank Accounts (Another ADT Example)

- Data

- Owner Name
 - Owner SSN
 - Balance
 - Transaction history
 - ...

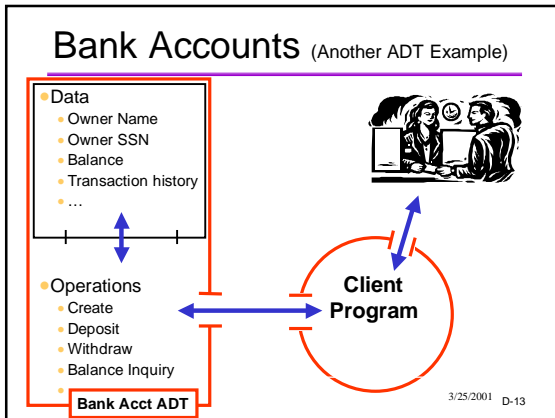

**Client
Program**

- Operations

- Create
 - Deposit
 - Withdraw
 - Balance Inquiry
 - ...

3/25/2001 D-12

Classes vs. Structs

- A lot like a C `struct` in syntax:

```
class BankAccount {
    // Class member declarations
};
```
- Two enhancements support encapsulation
 - Members (= components) can be functions
not just data
 - Can specify *private* vs. *public* members

3/25/2001 D-14

Great Ideas, but...

- How do we actually get modularity, abstraction, ADTs, black boxes, etc. in our programs?
- Terminology: "Encapsulation" means wrapping up the data and operations together in a clean package
- Historical note: for many years programmers have struggled to do this.
 - Recent programming languages make it (much) easier.
- Next topic: the key feature of C++ which helps achieve these modularity goals

3/25/2001 D-15
