

CSE 143

Beyond Basic C++

Templates
Modern Applications Development
Java
143 Wrapup

08/14/01 Z-1

What's Left To Do?

- Beyond the C++ covered in this course
 - **Templates**: a C++ power feature
 - There are many other topics we can't cover
- Trends in programming
- Applications development frameworks
 - MFC (C++)
- Java
- What do you do after CSE143?
- A look back at the topics in CSE143

08/14/01 Z-2

A Problem with Reusing Code

- Inheritance gives us a way to extend and reuse code
- Sometimes inheritance isn't the solution
- Example: Bank simulation. I have implemented a queue of customers; I also need a queue of stock transactions.
 - No "is-a" or "has-a" relationships between the items
 - Must reimplement the queue from scratch
- Would really like to have one Queue class, which could somehow be reused with different item types

08/14/01 Z-3

Templates

- A **template** is a general pattern for a class or a function in C++
- Everything is filled in, except one or more types
- Examples:
 - a queue template class, with all the definitions complete, methods implemented, etc, but the type of the data item left open as a parameter
 - a sort template function: type of the item being sorted is left open
- An extremely powerful feature of C++
 - Found in only a few advanced programming languages.

08/14/01 Z-4

A Template Class

```
template <class T> class Queue {
public:
    void insert(T item);
    T remove();
};

// in queue.cpp
template <class T>
void Queue<T>::insert(T item)
{ ... }
template <class T>
T Queue<T>::remove()
{ ... }
```

08/14/01 Z-5

Using Templates

```
Queue<int> intQueue;
Queue<double> dblQueue;
intQueue.insert(5); intQueue.insert(7);
dblQueue.insert(3.9); dblQueue.insert(-5.3);
double dv = dblQueue.remove();
int iv = intQueue.remove();

Queue<Book*> books;
books.insert(new Book("Moby Dick"));
books.insert(new Book("Java for Jaguars"));
Book *eveningReading = books.remove();
```

08/14/01 Z-6

Using MFC

- Hard to learn
 - "Wizards" help somewhat
 - Nevertheless, a big improvement over previous environment:
 - Win16/Win32 API: Hundreds of individual C functions
- Reasonably widely used
- Not perfectly integrated with Windows OS
 - mismatch with event handling
- **Not part of C++**
 - Mismatch or conflicts with standard libraries
 - Compiler can't check everything
 - Windows only - not available on other platforms

08/14/01 Z-13

Java

- A new language created by Sun Microsystems
- Based on C++, but simpler
 - similar syntax
 - no explicit pointers
 - 'new' but no 'delete': garbage collected
 - safety checking (array bounds, etc.)
 - no preprocessor
- Designed from the ground up to be
 - object-oriented
 - no stand-alone functions
 - GUI (AWT: Abstract Windows Toolkit, SWING)
 - platform-independent
 - Internet-friendly

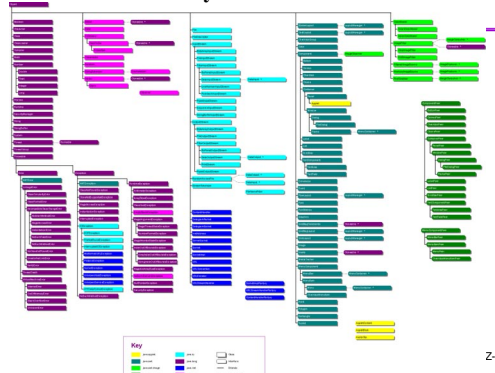

08/14/01 Z-14

Java's Object Model

- Similar to C++ in notation and overall concept
 - But some fundamental differences
- All classes descend from "Object"
- All methods automatically virtual
- Deliberately missing some C++ power features
 - No multiple inheritance
 - But provides "interfaces," which are similar to abstract base classes with no data.
 - No operator overloading
 - No templates (but some form of templates might be added to the language in the next year or two)

08/14/01 Z-15

Java Class Hierarchy Chart

Z-16

"Hello, World!" In Java

```
import javax.swing.*; // access libraries
import java.awt.*; // (similar idea to include
import java.awt.event.*; // but not the same)

// in Java, everything goes in a class
public class AnApplication {

    // main is "static"; one instance per class
    public static void main(String[] args) {
        // create a window frame
        JFrame frame = new JFrame("MyApplication");
        // create a label to go in it
        JLabel label = new JLabel("Hello, World!");
        frame.getContentPane().add(label);
```

08/14/01 Z-17

"Hello, World!" (cont)

```
// create an object to handle events
frame.addWindowListener(new WindowAdapter() {

    // called when the window is closed
    public void windowClosing(WindowEvent e) {
        System.exit(0); // exit the program!
    }
});

frame.pack(); // organize the frame
frame.setVisible(true); // show the frame
}
```

08/14/01 Z-18

Java Memory Model

- No “pointers” – use of references is implicit
`thing.method(argument);`
- All objects and arrays allocated on the heap – even if only used locally in a function
`Thing thing = new Thing();`
- Automatic garbage collection
 - Storage allocated to an object is reclaimed when the object is no longer accessible
 - No explicit “delete”
 - Rarely need destructors

08/14/01 Z-19

What's Beyond 143 For You?

- Computer-related majors
 - Some within the CSE Department (Computer Science and Engineering), some based elsewhere
- Other major + CSE courses
 - Long-term, a real winner
 - Combine interest/aptitude in any field with CS knowledge
- “Real-world” programming
 - Often involves maintenance of existing programs
 - Requires knowledge of customer application
 - Work as part of a team
 - May use some specialized programming tools

08/14/01 Z-20

Computer-Related Majors

- Within CSE:
 - **Computer Science (Arts & Sciences)**
 - **Computer Engineering (College of Engineering)**
- ACMS: Applied Computational and Mathematical Science (Arts and Sciences)
- Information Technology (Library School)
- Information Systems (Business School)
- Plus... UW Bothell and UW Tacoma offer a Software Systems

08/14/01 Z-21

CSE Courses

- After 143, it's assumed you can program!
- Non-majors courses
 - 373 (Data Structures) Most direct successor to 143
 - Then 410 (Computer Systems), 413 (Prog. Languages), 415 (Artificial Intelligence)
- Majors courses
 - Need permission if not CSE major
 - 321 (Discrete Structures)
 - 322 (Formal Models)
 - 326 (Data Structures)
 - 370 (Digital Logic)

08/14/01 Z-22

UW Certificate Programs

- Multi-course sequences
- Offered through UW Extension
 - Separate tuition, schedule, registration
 - Most classes in evenings or on weekends
 - Most lead to a “certificate” rather than UW credit
- Over a dozen: C, C++, Java, Perl, Windows, Internet, Graphics, Multimedia, etc. etc.
- Some can be applied toward a degree at UW Bothell

08/14/01 Z-23

Wrapping Up 143

- What did we learn?

[“Professor, why is this slide blank?”]

08/14/01 Z-24

Knowledge And Skills

- C++ Programming Specifics
 - Classes
 - Dynamic memory
 - Stream I/O, Overloading, other C++ specifics
- General programming
 - Recursion
 - Object-oriented programming style

-oriented. A clumsy, pretentious device, much in vogue.
Find a better way of indicating orientation or alignment
or direction.

W. Strunk & E. B. White, *The Elements of Style*

08/14/01 Z-25

Knowledge and Skills (cont.)

- Software Engineering
 - interpreting specs
 - building sizable systems
 - documenting (charts, descriptions, comments)
 - robustness
 - testing
 - techniques for code reuse
 - working in teams

08/14/01 Z-26

Knowledge and Skills (cont.)

- Data structures and algorithms
 - Analysis of complexity
 - Big-O notation
 - Classic ADTs: List, Queue, Stack
 - Sorting and Searching, incl. Binary Search, quadratic sorts, QuickSort, MergeSort
 - Tree concepts
 - Binary Trees and traversals
 - Binary Search Trees
 - Tables and hashing

08/14/01 Z-27
