

CSE 143 Java

Lists via Links

Reading: Ch. 23

2/19/2003

(c) 2002-2003 University of Washington

13-1

Review: List Implementations

- The external interface is already defined
- Implementation goal: implement methods “efficiently”
- ArrayList approach: use an array with extra space internally
- ArrayList efficiency
 - Iterating, indexing (get & set) is fast
Typically a one-liner
 - Adding at end is fast, except when we have to grow
 - Adding or removing in the middle is slow: requires sliding all later elements

2/19/2003

(c) 2002-2003 University of Washington

13-2

A Different Strategy: Lists via Links

Instead of packing all elements together in an array,

create a *linked chain* of all the elements

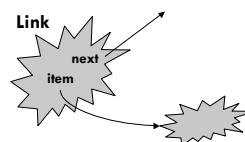

2/19/2003

(c) 2002-2003 University of Washington

13-3

Links

- For each element in the list, create a Link object
- Each Link points to the **data item** (element) at that position, and also points to the **next** Link in the chain

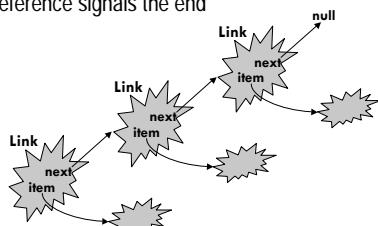

2/19/2003

(c) 2002-2003 University of Washington

13-4

Linked Links

- Each Link points to the next
- No limit on how many can be linked!
- A null reference signals the end

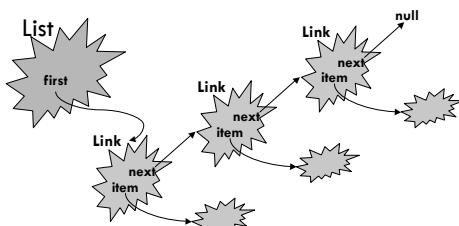

2/19/2003

(c) 2002-2003 University of Washington

13.5

Linked List

- The List has a reference to the first Link
- Altogether, the list involves 3 different object types

2/19/2003

(c) 2002-2003 University of Washington

13.6

Link Class: Data

```
/** Link for a simple list */
public class Link {
    public Object item;      // data associated with this link
    public Link next;        // next Link, or null if no next link
    //no more instance variables
    //but maybe some methods
} //end Link
```

Note 1: This class does NOT represent the chain, only one link of a chain
 Note 2: "public" violates normal practice – will discuss other ways later
 Note 3: The links are NOT part of the data. The data is totally unaware that it is part of a chain.

2/19/2003

(c) 2002-2003 University of Washington

13.7

Link Constructor

```
/** Link for a simple list */
public class Link {
    public Object item;      // data associated with this link
    public Link next;        // next Link, or null if none

    /** Construct new link with given data item and next link (or null if none) */
    public Link(Object item, Link next) {
        this.item = item;
        this.next = next;
    }
    ...
}
```

2/19/2003

(c) 2002-2003 University of Washington

13.8

LinkedList Data

```
/** Simple version of LinkedList for CSE143 lecture example */
public class SimpleLinkedList implements List {
    // instance variables
    private Link first;           // first link in the list, or null if list is empty
    ...
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-9

LinkedList Data & Constructor

```
/** Simple version of LinkedList for CSE143 lecture example */
public class SimpleLinkedList implements List {
    // instance variables
    private Link first;           // first link in the list, or null if list is empty
    ...
}

// construct new empty list
public SimpleLinkedList() {
    this.first = null;            // no links yet!
}
...
```

2/19/2003

(c) 2002-2003 University of Washington

13-10

List Interface (review)

- Operations to implement:

```
int size()
boolean isEmpty()
boolean add(Object o)
boolean addAll(Collection other)
void clear()
Object get(int pos)
boolean set(int pos, Object o)
int indexOf(Object o)
boolean contains(Object o)
Object remove(int pos)
boolean remove(Object o)
boolean add(int pos, Object o)
Iterator iterator()
```

- What don't we see anywhere here??

2/19/2003

(c) 2002-2003 University of Washington

13-11

Method add (First Try)

```
public boolean add(Object o) {
    // create new link and place at end of list:
    Link newLink = new Link(o, null);
    // find last link in existing chain: it's the one whose next link is null:
    Link p = this.first;
    while (p.next != null) {
        p = p.next;
    }
    // found last link: now add the new link after it:
    p.next = newLink;
    return true; // we changed the list => return true
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-12

Draw the Official CSE143 Picture

- Client code:

```
LinkedList vertexes = new SimpleLinkedList();
Point2D p1 = new Point2D.Double(100.0, 50.0);
Point2D p2 = new Point2D.Double(250, 310);
Point2D p3 = new Point2D.Double(90, 350.0);
vertexes.add(p1);
vertexes.add(p2);
vertexes.add(p3);
vertexes.add(p1);
```

2/19/2003

(c) 2002-2003 University of Washington

13-13

Problems with naïve *add* method

- Inefficient: requires traversal of entire list to get to the end
 - One loop iteration per link
 - Gets slower as list gets longer
 - Solution??
- Buggy: fails when adding first link to an empty list
 - Check the code: where does it fail?
 - Solution??

2/19/2003

(c) 2002-2003 University of Washington

13-14

Improvements to naïve *add* method

- Inefficient: requires traversal of entire list to get to the end
 - A solution:
 - Remove the constraint that instance variables are fixed.
 - Change `LinkedList` to keep a pointer to *last* link as well as the *first*
- Buggy: fails when adding first link to an empty list
 - A solution: check for this case and execute special code
- Q: "Couldn't we?" Answer: "probably". There are many ways link lists could be implemented

2/19/2003

(c) 2002-2003 University of Washington

13-15

List Data & Constructor (revised)

```
public class SimpleLinkedList implements List {
    // instance variables
    private Link first;           // first link in the list, or null if list is empty
    private Link last;            // last link in the list, or null if list is empty
    ...

    // construct new empty list
    public SimpleLinkedList() {
        this.first = null;          // no links yet!
        this.last = null;           // no links yet!
    }

    ...
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-16

Link List with last

2/19/2003

(c) 2002-2003 University of Washington

13-17

Method *add* (Final Version)

```
public boolean add(Object o) {
    // create new link to place at end of list:
    Link newLink = new Link(o, null);
    // check if adding the first link
    if (this.first == null) {
        // we're adding the first link
        this.first = newLink;
    } else {
        // we have some existing links; add the new link after the old last link
        this.last.next = newLink;
    }
    // update the last link
    this.last = newLink;
    return true; // we changed the list => return true
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-18

Method *size()*

- First try it with this restriction: you can't add or redefine instance variables
- Hint: count the number of links in the chain

```
/** Return size of this list */
public int size() {
    int count = 0;

    return count;
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-19

Method *size()*

- Solution: count the number of links in the list

```
/** Return size of this list */
public int size() {
    int count = 0;
    Iterator iter = this.iterator();
    while (iter.hasNext()) {
        count++;
        iter.next(); // ignore the link itself!
    }
    return count;
}
```

- Critique?

2/19/2003

(c) 2002-2003 University of Washington

13-20

Method size (revised)

- Add an instance variable to the list class

```
int numLinks; // number of links in this list
```
- Add to constructor:
- Add to method add:
- Method size (new version)

```
/* Return size of this list */  
public int size() {  
}  
}
```
- Critique?

2/19/2003

(c) 2002-2003 University of Washington

13-21

Method size (revised)

- Add an instance variable to the list class

```
int numLinks; // number of links in this list
```
- Add to constructor:

```
this.numLinks = 0;
```
- Add to method add:

```
this.numLinks ++;
```
- Method size

```
/* Return size of this list */  
public int size() {  
    return this.numLinks;  
}
```
- Critique?

2/19/2003

(c) 2002-2003 University of Washington

13-22

clear

- Simpler than with arrays or not?

```
/* Clear this list */  
public void clear() {  
    this.first = null;  
    this.last = null;  
    this.numLinks = 0;  
}
```
- No need to "null out" the elements themselves
 - Garbage Collector will reclaim the Link objects automatically
 - But – garbage collection would work better with explicit nulling out

2/19/2003

(c) 2002-2003 University of Washington

13-23

get

```
/* Return object at position pos of this list. 0 <= pos < size, else IndexOOBExn */  
public Object get(int pos) {  
    if (pos < 0 || pos >= this.numLinks) {  
        throw new IndexOutOfBoundsException();  
    }  
    // search for pos'th link  
    Link p = this.first;  
    for (int k = 0; k < pos; k++) {  
        p = p.next;  
    }  
    // found it; now return the element in this link  
    return p.item;  
}  
• Critique?  
• DO try this at home. Try "set" too
```

2/19/2003

(c) 2002-2003 University of Washington

13-24

add and remove at given position

- Observation: to add a link at position k, we need to change the next pointer of the link at position k-1

- Observation: to remove a link at position k, we need to change the next pointer of the link at position k-1

2/19/2003

(c) 2002-2003 University of Washington

13-25

Helper for add and remove

- Possible helper method: get link given its position

```
// Return the link at position pos
// precondition (unchecked): 0 <= pos < size
private Link getLinkAtPos(int pos) {
    Link p = this.first;
    for (int k = 0; k < pos; k++) {
        p = p.next;
    }
    return p;
}
```

- Use this in get, too

- How is this different from the get(pos) method of the List?

2/19/2003

(c) 2002-2003 University of Washington

13-26

remove(pos): Study at Home!

```
/** Remove the object at position pos from this list. 0 <= pos < size, else IndexOutOfBoundsException */
public Object remove(int pos) {
    if (pos < 0 || pos >= this.numLinks) { throw new IndexOutOfBoundsException(); }
    Object removedElem;
    if (pos == 0) {
        removedElem = this.first.item;           // remember removed item, to return it
        this.first = this.first.next;            // remove first link
        if (this.first == null) { this.last = null; } // update last, if needed
    } else {
        Link prev = getLinkAtPos(pos-1);         // find link before one to remove
        removedElem = prev.next.item;            // remember removed item, to return it
        prev.next = prev.next.next;              // splice out link to remove
        if (prev.next == null) { this.last = prev; } // update last, if needed
    }
    this.numLinks--;                         // remember to decrement the size!
    return removedElem;
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-27

add(pos): Study at Home!

```
/** Add object o at position pos in this list. 0 <= pos <= size, else IndexOutOfBoundsException */
public boolean add(int pos, Object o) {
    if (pos < 0 || pos >= this.numLinks) { throw new IndexOutOfBoundsException(); }
    if (pos == 0) {
        this.first = new Link(o, this.first);           // insert new link at the front of the chain
        if (this.last == null) { this.last = this.first; } // update last, if needed
    } else {
        Link prev = getLinkAtPos(pos-1);               // find link before one to insert
        prev.next = new Link(o, prev.next);             // splice in new link between prev & prev.next
        if (this.last == prev) { this.last = prev.next; } // update last, if needed
    }
    this.numLinks++;                         // remember to increment the size!
    return true;
}
```

2/19/2003

(c) 2002-2003 University of Washington

13-28

Implementing *iterator()*

- To implement an iterator, could do the same thing as with SimpleArrayLists: return an instance of SimpleListIterator
- Recall: SimpleListIterator tracks the List and the position (index) of the next item to return
 - How efficient is this for LinkedLists?
 - Can we do better?

2/19/2003

(c) 2002-2003 University of Washington

13-29

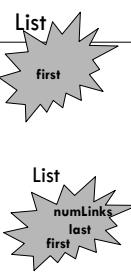

Summary

- SimpleLinkedList presents same illusion to its clients as SimpleArrayList
- Key implementation ideas:
 - a chain of links
- Different efficiency trade-offs than SimpleArrayList
 - must search to find positions, but can easily insert & remove without growing or sliding
 - get, set a lot slower
 - add, remove faster (particularly at the front): no sliding required
