Recursive Programming

reading: 12.2 - 12.3

slides created by Marty Stepp

<http://www.cs.washington.edu/143/>

# Exercise

- Write a recursive method `pow` accepts an integer base and exponent and returns the base raised to that exponent.
  - Example: `pow(3, 4)` returns 81
  - Solve the problem recursively and without using loops.

# pow solution

```
// Returns base ^ exponent.  
// Precondition: exponent >= 0  
public static int pow(int base, int exponent) {  
    if (exponent == 0) {  
        // base case; any number to 0th power is 1  
        return 1;  
    } else {  
        // recursive case:  $x^y = x * x^{(y-1)}$   
        return base * pow(base, exponent - 1);  
    }  
}
```

# An optimization

- Notice the following mathematical property:

$$\begin{aligned} 3^{12} &= 531441 &= 9^6 \\ & &= (3^2)^6 \\ & & &= (9^2)^3 \\ & & &= ((3^2)^2)^3 \end{aligned}$$

- When does this "trick" work?
- How can we incorporate this optimization into our `pow` method?
- What is the benefit of this trick if the method already works?

# pow solution 2

```
// Returns base ^ exponent.
// Precondition: exponent >= 0
public static int pow(int base, int exponent) {
    if (exponent == 0) {
        // base case; any number to 0th power is 1
        return 1;
    } else if (exponent % 2 == 0) {
        // recursive case 1:  $x^y = (x^2)^{(y/2)}$ 
        return pow(base * base, exponent / 2);
    } else {
        // recursive case 2:  $x^y = x * x^{(y-1)}$ 
        return base * pow(base, exponent - 1);
    }
}
```

# Exercise

- Write a recursive method `printBinary` that accepts an integer and prints that number's representation in binary (base 2).
  - Example: `printBinary(7)` prints `111`
  - Example: `printBinary(12)` prints `1100`
  - Example: `printBinary(42)` prints `101010`

place	10	1
value	<b>4</b>	<b>2</b>

32	16	8	4	2	1
<b>1</b>	<b>0</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>0</b>

- Write the method recursively and without using any loops.

# Case analysis

- Recursion is about solving a small piece of a large problem.
  - What is 69743 in binary?
    - Do we know *anything* about its representation in binary?
  - Case analysis:
    - What is/are easy numbers to print in binary?
    - Can we express a larger number in terms of a smaller number(s)?
  - Suppose we are examining some arbitrary integer  $N$ .
    - if  $N$ 's binary representation is **10010101011**
    - $(N / 2)$ 's binary representation is **1001010101**
    - $(N \% 2)$ 's binary representation is **1**

# printBinary solution

```
// Prints the given integer's binary representation.  
// Precondition: n >= 0  
public static void printBinary(int n) {  
    if (n < 2) {  
        // base case; same as base 10  
        System.out.println(n);  
    } else {  
        // recursive case; break number apart  
        printBinary(n / 2);  
        printBinary(n % 2);  
    }  
}
```

– Can we eliminate the precondition and deal with negatives?

# printBinary solution 2

```
// Prints the given integer's binary representation.
public static void printBinary(int n) {
    if (n < 0) {
        // recursive case for negative numbers
        System.out.print("-");
        printBinary(-n);
    } else if (n < 2) {
        // base case; same as base 10
        System.out.println(n);
    } else {
        // recursive case; break number apart
        printBinary(n / 2);
        printBinary(n % 2);
    }
}
```

# Exercise

- Write a recursive method `isPalindrome` accepts a `String` and returns `true` if it reads the same forwards as backwards.
  - `isPalindrome("madam")` → `true`
  - `isPalindrome("racecar")` → `true`
  - `isPalindrome("step on no pets")` → `true`
  - `isPalindrome("able was I ere I saw elba")` → `true`
  - `isPalindrome("Java")` → `false`
  - `isPalindrome("rotater")` → `false`
  - `isPalindrome("byebye")` → `false`
  - `isPalindrome("notion")` → `false`

# Exercise solution

```
// Returns true if the given string reads the same
// forwards as backwards.
// Trivially true for empty or 1-letter strings.
public static boolean isPalindrome(String s) {
    if (s.length() < 2) {
        return true;    // base case
    } else {
        char first = s.charAt(0);
        char last  = s.charAt(s.length() - 1);
        if (first != last) {
            return false;
        }
        // recursive case
        String middle = s.substring(1, s.length() - 1);
        return isPalindrome(middle);
    }
}
```

# Exercise solution 2

```
// Returns true if the given string reads the same
// forwards as backwards.
// Trivially true for empty or 1-letter strings.
public static boolean isPalindrome(String s) {
    if (s.length() < 2) {
        return true;    // base case
    } else {
        return s.charAt(0) == s.charAt(s.length() - 1)
            && isPalindrome(s.substring(1, s.length() - 1));
    }
}
```

# Exercise

- Write a recursive method `reverseLines` that accepts a file `Scanner` and prints the lines of the file in reverse order.

– Example input file:

```
Roses are red,  
Violets are blue.  
All my base  
Are belong to you.
```

Expected console output:

```
Are belong to you.  
All my base  
Violets are blue.  
Roses are red,
```

- What are the cases to consider?
  - How can we solve a small part of the problem at a time?
  - What is a file that is very easy to reverse?

# Reversal pseudocode

- Reversing the lines of a file:
  - Read a line L from the file.
  - Print the rest of the lines in reverse order.
  - Print the line L.
  
- If only we had a way to reverse the rest of the lines of the file....

# Reversal solution

```
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) {  
        // recursive case  
        String line = input.nextLine();  
        reverseLines(input);  
        System.out.println(line);  
    }  
}
```

- Where is the base case?

# Tracing our algorithm

- **call stack:** The method invocations running at any one time.

```
reverseLines(new Scanner("poem.txt"));
```

```
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) {  
        String line = input.nextLine(); // "Roses are red "  
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) {  
        String line = input.nextLine(); // "Violets are blue "  
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) {  
        String line = input.nextLine(); // "All my base"  
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) {  
        String line = input.nextLine(); // "Are belong to you "  
public static void reverseLines(Scanner input) {  
    if (input.hasNextLine()) { // false  
        ...  
    }  
}
```

```
roses are red,  
Violets are blue.  
All my base  
Are belong to you.
```

```
Are belong to you.  
All my base  
Violets are blue.  
Roses are red,
```
