# Building Java Programs 

Binary Trees

reading: 17.1-17.3

## Trees

- tree: A directed, acyclic structure of linked nodes.
- directed : Has one-way links between nodes.
- acyclic: No path wraps back around to the same node twice.
- binary tree: One where each node has at most two children.
- Recursive definition: A tree is either:
- empty (null), or
- a root node that contains:
- data,
- a left subtree, and
- a right subtree.
- (The left and/or right subtree could be empty.)

## Trees in computer science

- folders/files on a computer
- family genealogy; organizational charts
- AI: decision trees
- compilers: parse tree
$-a=(b+c) * d ;$
- cell phone T9

## Terminology

- node: an object containing a data value and left/right children
- root: topmost node of a tree
- leaf: a node that has no children
- branch: any internal node; neither the root nor a leaf
- parent: a node that refers to this one
- child: a node that this node refers to
- sibling: a node with a common parent
- subtree: the smaller tree of nodes on level 2 the left or right of the current node
- height: length of the longest path from the root to any node
- level or depth: length of the path level 3
 from a root to a given node

## A tree node for integers

- A basic tree node object stores data, refers to left/right
- Multiple nodes can be linked together into a larger tree

## IntTreeNode class

/ An IntTreeNode object is one node in a binary tree of ints.
public class IntTreeNode \{
public int data; // data stored at this node
public IntTreeNode left; // reference to left subtree
public IntTreeNode right; // reference to right subtree
// Constructs a leaf node with the given data.
public IntTreeNode(int data) \{
this(data, null, null);
\}
// Constructs a branch node with the given data and links.
public IntTreeNode(int data, IntTreeNode left,
IntTreeNode right) \{
this.data $=$ data;
this.left = left;
this.right = right;
\}

## IntTree class

// An IntTree object represents an entire binary tree of ints.
public class IntTree \{
private IntTreeNode overallRoot; // null for an empty tree
methods

- Client code talks to the IntTree, not to the node objects inside it.
- Methods of the IntTree create and manipulate the nodes, their data and links between them.

## IntTree constructors

- For now, assume we have the following constructors:

```
public IntTree(IntTreeNode overallRoot)
public IntTree(int height)
```

- The 2nd constructor will create a tree and fill it with nodes with random data values from 1-100 until it is full at the given height.
overallRoot

IntTree tree = new IntTree(3);

## Exercise

- Add a method print to the IntTree class that prints the elements of the tree, separated by spaces.
- A node's left subtree should be printed before it, and its right subtree should be printed after it.
- Example: tree.print();

294161781940

## Exercise solution

```
// An IntTree object represents an entire binary tree of ints.
public class IntTree {
    private IntTreeNode overallRoot; // null for an empty tree
    ...
    public void print() {
        print(overallRoot);
        System.out.println(); // end the line of output
    }
    private void print(IntTreeNode root) (
    // (base case is implicitly to do nothing on null)
    if (root != null) {
        // recursive case: print left, center, right
        print(overallRoot.left);
        System.out.print(overallRoot.data + " ");
        print(overallRoot.right);
    }
}
}
```

## Template for tree methods

```
public class IntTree {
    private IntTreeNode overallRoot;
    ...
    public type name(parameters)
        name(overallRoot, parameters);
    }
    private type name(IntTreeNode root, parameters) {
    }
}
```

- Tree methods are often implemented recursively
- with a public/private pair
- the private version accepts the root node to process

## Exercise

- Add a method contains to the IntTree class that searches the tree for a given integer, returning true if it is found.
- If an IntTree variable tree referred to the tree below, the following calls would have these results:

```
- tree.contains(87) -> true
- tree.contains(60) -> true
- tree.contains(63) -> false
- tree.contains(42) }->\mathrm{ false
```

## Exercise solution

```
// Returns whether this tree contains the given integer.
public boolean contains(int value) {
    return contains(overallRoot, value);
}
private boolean contains(IntTreeNode node, int value)
    if (node == null) {
        return false; // base case: not found here
    } else if (node.data == value) {
        return true; // base case: found here
    } else {
        // recursive case: search left/right subtrees
        return contains(node.left, value) ||
                contains(node.right, value);
    }
}
```

## Exercise

- Add a method named printSideways to the IntTree class that prints the tree in a sideways indented format, with right nodes above roots above left nodes, with each level 4 spaces more indented than the one above it.
- Example: Output from the tree below:

overall root

## Exercise solution

```
// Prints the tree in a sideways indented format.
public void printSideways() {
        printSideways (overallRoot, "");
}
private void printSideways(IntTreeNode root,
                        String indent) {
    if (root != null) {
        printSideways(root.right, indent + " ");
        System.out.println(indent + root.data);
        printSideways(root.left, indent + " ");
    }
```

\}

## Traversals

- traversal: An examination of the elements of a tree.
- A pattern used in many tree algorithms and methods
- Common orderings for traversals:
- pre-order:
- in-order:
- post-order:
process root node, then its left/right subtrees process left subtree, then root node, then right process left/right subtrees, then root node
overallRoot

## Traversal example

- pre-order: 174129698140
- in-order: 294161781940
- post-order: 296418140917

## Traversal trick

- To quickly generate a traversal:
- Trace a path around the tree.
- As you pass a node on the proper side, process it.
- pre-order: left side
- in-order: bottom
- post-order: right side

- pre-order: 174129698140
- in-order: 294161781940
- post-order: $29 \quad 6418140 \quad 917$

## Exercise

- Give pre-, in-, and post-order traversals for the following tree:
