

# CSE 143

## Recursive backtracking

# Exercise: Dice rolls

- Write a method `diceRoll` that accepts an integer parameter representing a number of 6-sided dice to roll, and output all possible arrangements of values that could appear on the dice.

```
diceRoll(2);
```

[1, 1]	[3, 1]	[5, 1]
[1, 2]	[3, 2]	[5, 2]
[1, 3]	[3, 3]	[5, 3]

# Examining the problem

- We want to generate all possible sequences of values.

for (each possible first die value):

    for (each possible second die value):

        for (each possible third die value):

...

    print!

- This is called a **depth-first search**
- How can we completely explore such a large search space?

# A decision tree

chosen	available
-	4 dice

# Exercise: Dice roll sum

- Write a method `diceSum` similar to `diceRoll`, but it also accepts a desired sum and prints only arrangements that add up to exactly that sum.

```
diceSum(2, 7);
```

```
[1, 6]  
[2, 5]  
[3, 4]  
[4, 3]  
[5, 2]  
[6, 1]
```

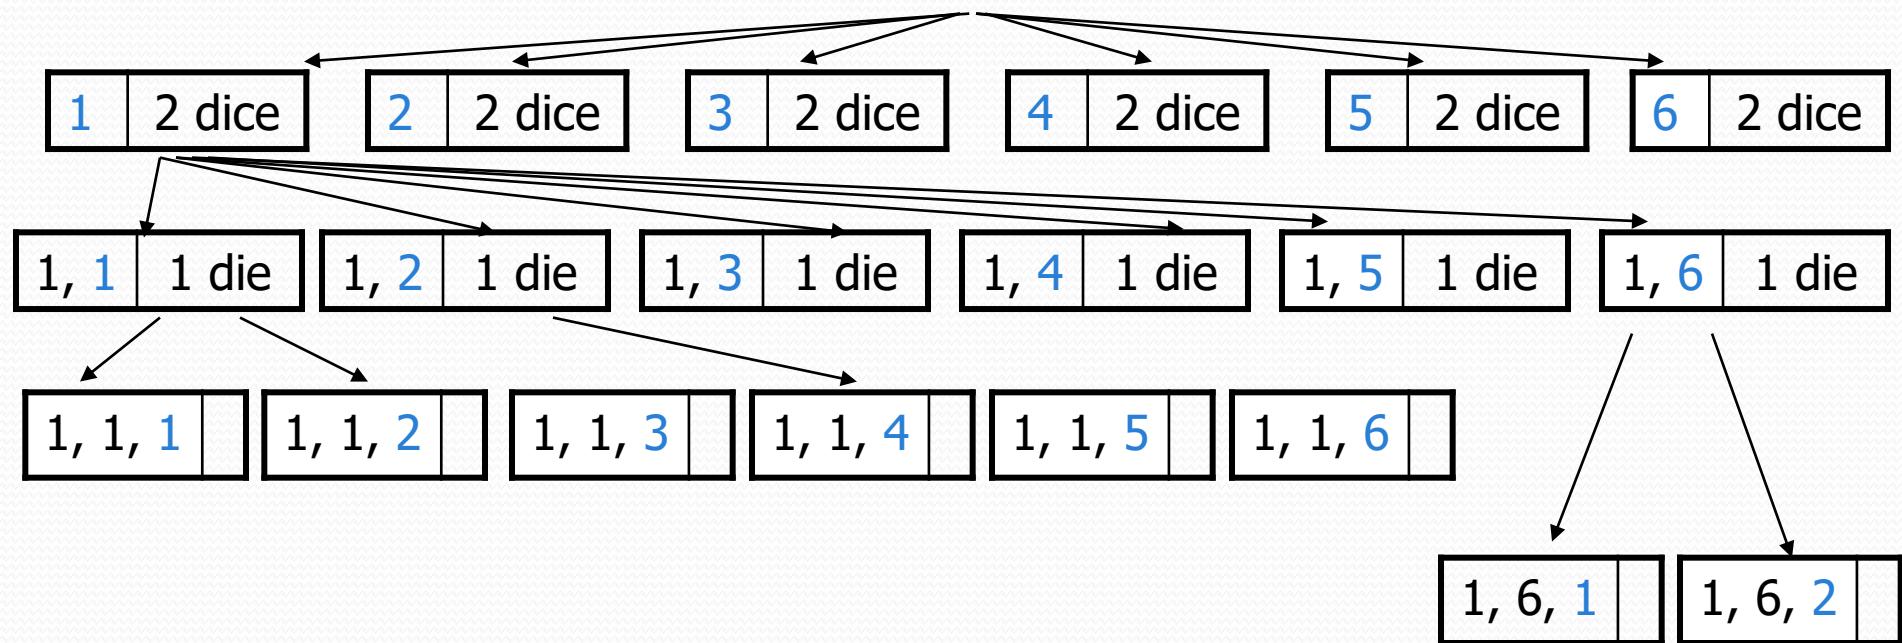

```
diceSum(3, 7);
```

```
[1, 1, 5]  
[1, 2, 4]  
[1, 3, 3]  
[1, 4, 2]  
[1, 5, 1]  
[2, 1, 4]  
[2, 2, 3]  
[2, 3, 2]  
[2, 4, 1]  
[3, 1, 3]  
[3, 2, 2]  
[3, 3, 1]  
[4, 1, 2]  
[4, 2, 1]  
[5, 1, 1]
```

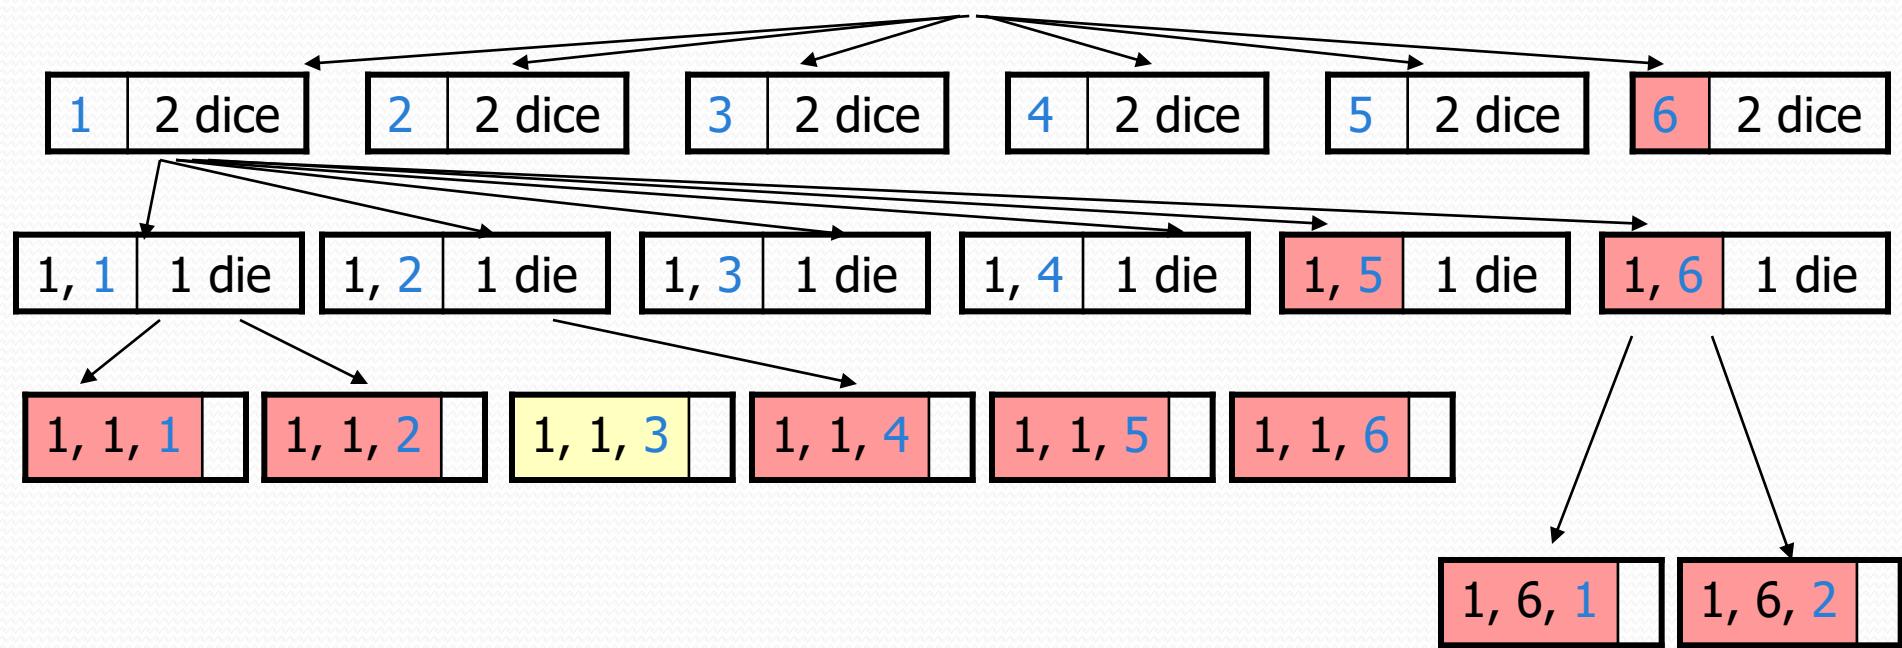

# Consider all paths?

chosen	available	desired sum
-	3 dice	5

# New decision tree

<b>chosen</b>	<b>available</b>	<b>desired sum</b>
-	3 dice	5

# Backtracking

- **backtracking:** Finding solution(s) by trying partial solutions and then abandoning them if they are not suitable.
  - a "brute force" algorithmic technique (tries all paths)
  - often implemented recursively

Applications:

- producing all permutations of a set of values
- parsing languages
- games: anagrams, crosswords, word jumbles, 8 queens
- combinatorics and logic programming

# Backtracking algorithms

*A general pseudo-code algorithm for backtracking problems:*

Explore(**choices**):

- if there are no more **choices** to make: stop.
- else:
  - Make a single choice **C**.
  - Explore the remaining **choices**.
  - Un-make choice **C**, if necessary. (backtrack!)

# Backtracking strategies

- When solving a backtracking problem, ask these questions:
  - What are the "choices" in this problem?
    - What is the "base case"? (How do I know when I'm out of choices?)
  - How do I "make" a choice?
    - Do I need to create additional variables to remember my choices?
    - Do I need to modify the values of existing variables?
  - How do I explore the rest of the choices?
    - Do I need to remove the made choice from the list of choices?
  - Once I'm done exploring, what should I do?
  - How do I "un-make" a choice?

# Exercise: Combinations

- Write a method `combinations` that accepts a string  $s$  and an integer  $k$  as parameters and outputs all possible  $k$ -letter words that can be formed from unique letters in that string. The arrangements may be output in any order.
  - Example:  
`combinations ("GOOGLE", 3)`  
outputs the sequence of  
lines at right.
  - To simplify the problem, you may assume  
that the string  $s$  contains at least  $k$   
unique characters.

EGL	LEG
EGO	LEO
ELG	LGE
ELO	LGO
EOG	LOE
EOL	LOG
GEL	OEG
GEO	OEL
GLE	OGE
GLO	OGL
GOE	OLE
GOL	OLG

# Initial attempt

```
public static void combinations(String s, int length) {  
    combinations(s, "", length);  
}  
  
private static void combinations(String s, String chosen, int length) {  
    if (length == 0) {  
        System.out.println(chosen);      // base case: no choices left  
    } else {  
        for (int i = 0; i < s.length(); i++) {  
            String ch = s.substring(i, i + 1);  
            if (!chosen.contains(ch)) {  
                String rest = s.substring(0, i) + s.substring(i + 1);  
                combinations(rest, chosen + ch, length - 1);  
            }  
        }  
    }  
}
```

- Problem: Prints same string multiple times.

# Exercise solution

```
public static void combinations(String s, int length) {  
    Set<String> all = new TreeSet<String>();  
    combinations(s, "", all, length);  
    for (String comb : all) {  
        System.out.println(comb);  
    }  
}  
  
private static void combinations(String s, String chosen,  
                                Set<String> all, int length) {  
    if (length == 0) {  
        all.add(chosen);  
        // base case: no choices left  
    } else {  
        for (int i = 0; i < s.length(); i++) {  
            String ch = s.substring(i, i + 1);  
            if (!chosen.contains(ch)) {  
                String rest = s.substring(0, i) + s.substring(i + 1);  
                combinations(rest, chosen + ch, all, length - 1);  
            }  
        }  
    }  
}
```

# Exercise: Permutations

- Write a method `permute` that accepts a string as a parameter and outputs all possible rearrangements of the letters in that string. The arrangements may be output in any order.

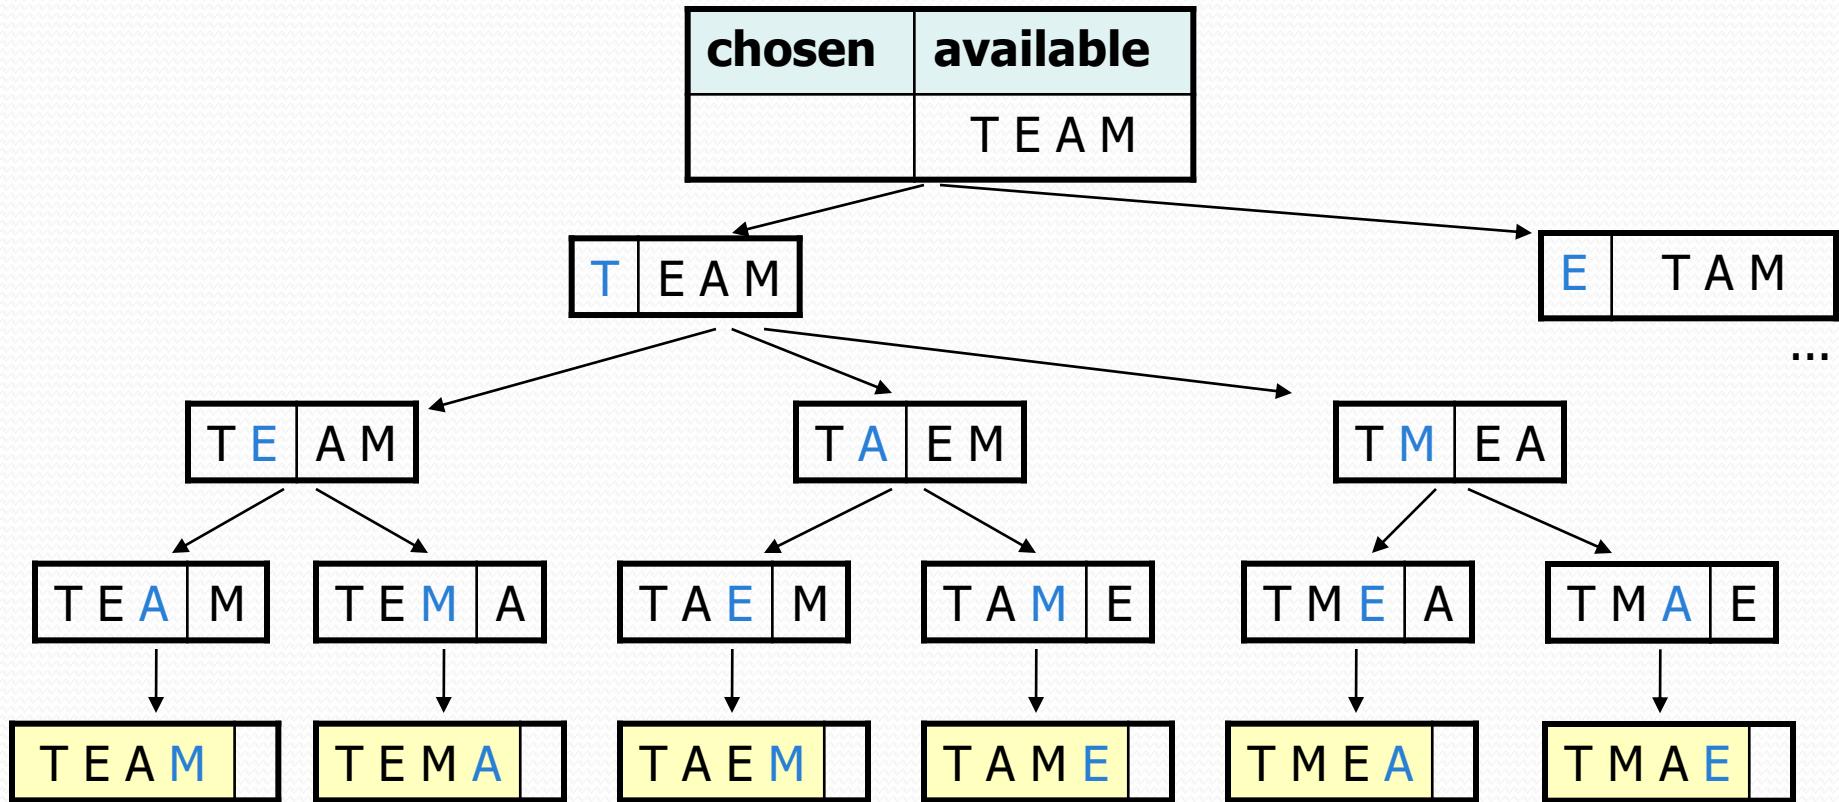

- Example:

`permute ("TEAM")`

outputs the following sequence of lines:

TEAM	ATEM
TEMA	ATME
TAEM	AETM
TAME	AEMT
TMEA	AMTE
TMAE	AMET
ETAM	MTEA
ETMA	MTAE
EATM	META
EAMT	MEAT
EMTA	MATE
EMAT	MAET

# Decision tree

# Exercise solution

```
// Outputs all permutations of the given string.
public static void permute(String s) {
    permute(s, "");
}

private static void permute(String s, String chosen) {
    if (s.length() == 0) {
        // base case: no choices left to be made
        System.out.println(chosen);
    } else {
        // recursive case: choose each possible next letter
        for (int i = 0; i < s.length(); i++) {
            char c = s.charAt(i);                      // choose
            s = s.substring(0, i) + s.substring(i + 1);
            chosen += c;

            permute(s, chosen);                      // explore

            s = s.substring(0, i) + c + s.substring(i);
            chosen = chosen.substring(0, chosen.length() - 1);
        }
    }
}
```
