CSE 143

Computer Programming II

ArrayIntList

Questions From Last Time

- Is the book required?
  - I want you to do what's best for you. I rarely recommend textbooks in classes I teach, but I actually like this one a lot.
- How do I review CSE 142?
  - Review session on Monday at 3:30pm - 5:00pm in EEB 105
  - http://courses.cs.washington.edu/courses/cse143/16sp/lectures/03-28/slides/review.pdf
  - http://practiceit.cs.washington.edu/problem/list
- Is it bad form to make an ArrayList where an Array would do?
  - Yes. We'll get there, but the short answer is "if you know the size upfront, using an ArrayList is a waste".
- How much help on HW can we get from the IPL and office hours?
  - Great question. We won't "pre-grade" your homework, but any other sorts of questions are fair game. If you ask a question, the worst that can happen is we'll say "we can't answer that".
- How can I help others without cheating?
  - You can work together on anything that isn't homework. Practice-it, practice exams, lecture problems, ...

Questions From Last Time

- emacs or vi?
  - vim. full stop.
- Favorite programming language?
  - It depends on the situation. For quick and dirty scripts, Python. For teaching intro, Java. For writing clean code, Haskell. ...
- Favorite color?
  - Green (see slides.)
- What's your favorite candy?
  - Not sure. I have celiac disease; so, I'm severely limited in what I can eat.
- Macbook or surface?
  - My main machine is a macbook, but I lecture from the surface. I'd recommend them both!
- Do you want to jump rope in class?
  - Nope. I'm good. Do you?
- Does CSE have a room "CSE 404"?
  - It doesn't. I have joked about this before.

Questions From Last Time

- At what level should my pikachu be before I use a thunderstone to evolve it?
  - http://www.gamefaqs.com/boards/696959-pokemon-x/67478014
  - http://www.gamefaqs.com/boards/696959-pokemon-x/69305531
  - http://pokemondb.net/pokebase/84886/when-is-a-good-time-to-evolve-pikachu-into-raichu

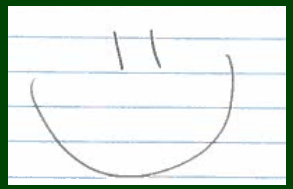
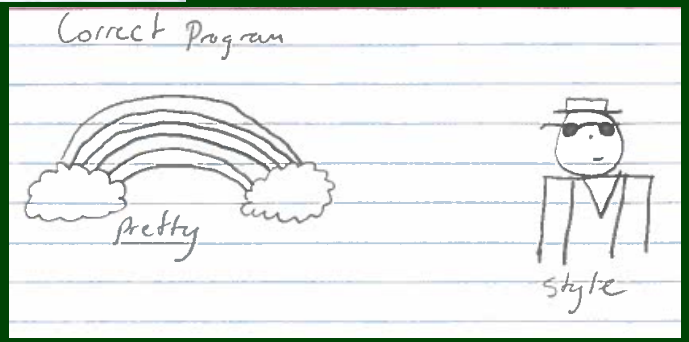
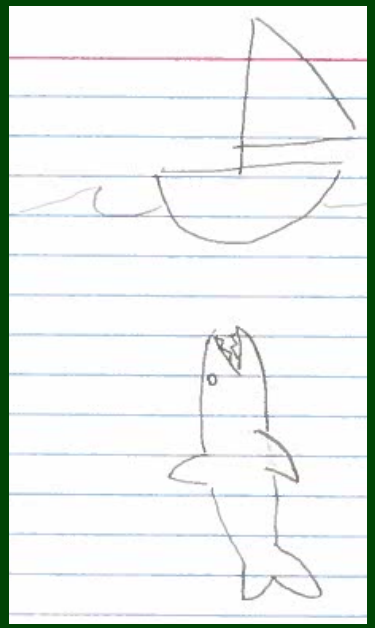
Hey.
I'm No



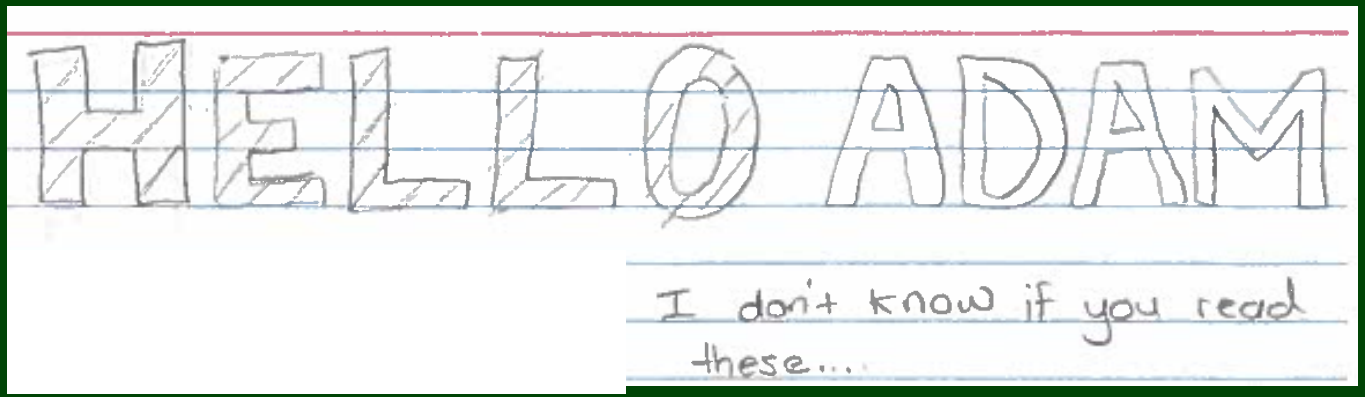


Correct Program
pretty
style

Drawings (continued)



Drawings (continued)



An `ArrayList` Client

```
1  public class ArrayIntListClient {
2     // Notice the main! That's usually a signal that we're a client!
3     public static void main(String[] args) {
4        // BUG: We haven't specified what "type" the list contains!
5        ArrayList list = new ArrayList();
6        for (int i = 0; i < 20; i++) {
7           list.add(i);
8        }
9       System.out.println(list);
10    }
11 }
```

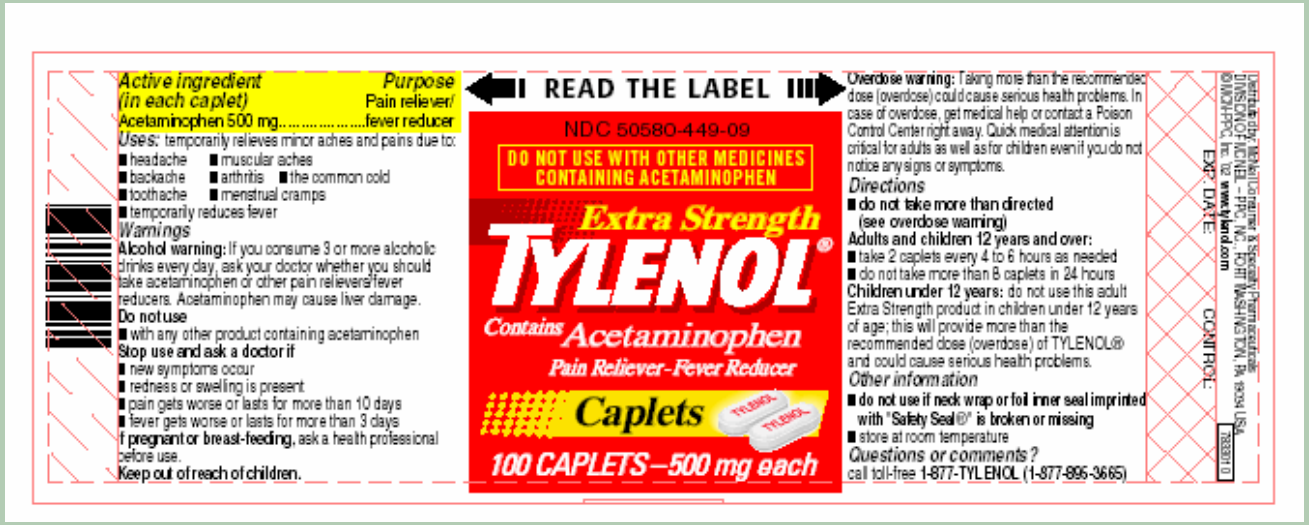
Today's Goal

Replace Java's `ArrayList` with our own version!

Another way of saying this: we will **implement** `ArrayList`.

Client vs. Implementor: Medication

For a tylenol pill, who is the client? Who is the implementor?



Java Examples

You've already been a client!

- `DrawingPanel`
- `ArrayList`

You've already been an implementor!

- `Critter`

`int` vs. `Integer` `char` vs. `Character` `double` vs. `Double`

The **lowercase** versions are **primitive types**; the **uppercase** versions are "wrapper classes".

The following is valid code:

```
1 int a = 5;
2 Integer b = 10;
3 int c = a + b; //You can treat ints and Integers as the same
```

When we create `ArrayList`'s, we must use **non-primitive types**. So:

```
1 ArrayList<int> bad1 = new ArrayList<int>(); // This won't compile!
2 // v This will work.
3 ArrayList<Integer> better = new ArrayList<Integer>();
4 better.add(5); // We can add an 'int' to an 'Integer' ArrayList
```

Class

A **Class** is

- a complete program, or
- a "template" for a type

(Examples: `ArrayList`, `ReverseFile`, ...)

The class explains what an object is, an **instance** is a particular version of the object.

```
1 ArrayList<String> list1 = new ArrayList<String>();
2 ArrayList<String> list2 = new ArrayList<String>()
3 //list1 and list2 are instances of ArrayList
```

Object

An **Object** combines **state** and **behavior**.

Java is an "object-oriented" programming language (OOP); programs consist of objects interacting with each other.

A class is made up of **field(s)**, **constructor(s)**, and **method(s)**.
Let's make an object `Circle` that represents a circle...

- with a size
- that can be moved right
- at a particular location

```
1  public class Circle {
2     /* Fields */
3     private int radius;
4     private int x;
5     private int y;
6
7     /* Constructor */
8     public Circle(int radius, int x, int y) {
9        this.radius = radius;
10       this.x = x;
11       this.y = y;
12    }
13
14    /* Methods */
15    public void moveRight(int numberOfUnits) {
16       this.x += numberOfUnits;
17    }
18 }
```

Implementor View of `ArrayList`

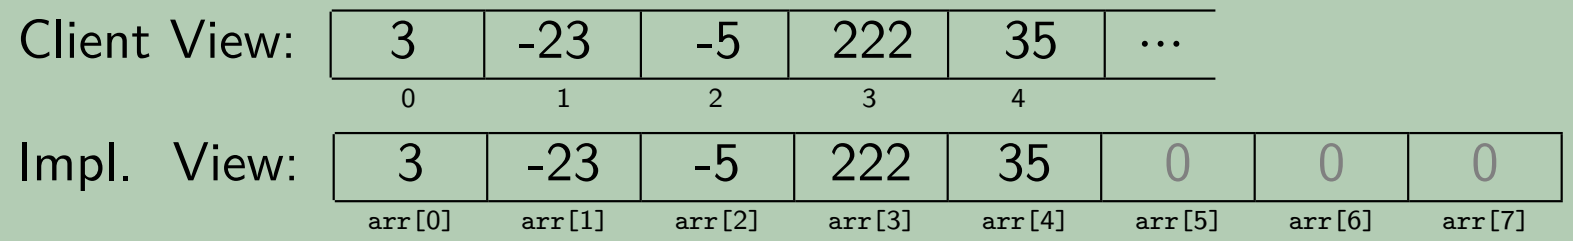
What behavior should we support? (Methods)

`add`, `remove`, `indexOf`, etc.

What state do we keep track of? (Fields)

- Elements stored in the `ArrayList` (probably stored as an array!)
- Size of `ArrayList`

Two Views of an `ArrayList`



- No generics (only stores ints)
- Fewer methods: `add`(value), `add`(index, value), `get`(index), `set`(index, value), `size`(), `isEmpty`(), `remove`(index), `indexOf`(value), `contains`(value), `toString`()

Implementing `add`

(size = 4)

3	8	2	45	0	0	0	0
`lst[0]`	`lst[1]`	`lst[2]`	`lst[3]`	`lst[4]`	`lst[5]`	`lst[6]`	`lst[7]`

`lst.add(222)`:

(size = 5)

3	8	2	45	**222**	0	0	0
`lst[0]`	`lst[1]`	`lst[2]`	`lst[3]`	`lst[4]`	`lst[5]`	`lst[6]`	`lst[7]`

How do we add to the end of the list?

- Put the element in the last slot
- Increment the size

```
1 public void add(int value) {
2    this.data[this.size] = value;
3    this.size++;
4 }
```

Printing an ArrayIntList

`System.out.println` automatically calls `toString` on the given object. `toString` looks like:

```
1  public String toString() {
2     ...
3  }
```

`ArrayIntList toString`:

```
1  public String toString() {
2     if (this.size == 0) {
3        return "[]";
4     }
5     else {
6        String result = "[" + this.data[0];
7        for (int i = 1; i < this.size; i++) {
8           result += ", " + this.data[i];
9        }
10       result += "]";
11       return result;
12    }
13 }
```

Implementing `add` #2

(size = 4)

3	8	2	45	0	0	0	0
list[0]	list[1]	list[2]	list[3]	list[4]	list[5]	list[6]	list[7]

`list.add(1, 222)`:

(size = 5)

3	**222**	**8**	**2**	**45**	0	0	0
list[0]	list[1]	list[2]	list[3]	list[4]	list[5]	list[6]	list[7]

How do we add to the middle of the list?

- Shift over all elements starting from the end
- Put the new element in its index
- Increment the size

```
1 public void add(int index, int value) {
2    for (int i = this.size; i > index; i--) {
3       this.data[i] = this.data[i - 1];
4    }
5    this.data[index] = value;
6    this.size++;
7 }
```

Today's Takeaways!

- Understand the difference between client and implementor
- Always use wrapper classes when creating an `ArrayList` of a primitive type
- Understand how `ArrayList` is implemented
