Recursive backtracking

Exhaustive Search

- Iterate through all elements of a search space
- Useful to solve problems that require making decisions
 - Each decision leads to new choices
 - Insufficient information to make a thoughtful choice
- Depth first search: we go deep down one path rather than broad
- Natural to implement recursively: call stack keeps track of decision points in right order (opposite from visited)

Exercise: Permutations

- Write a method `permute` that accepts a string as a parameter and outputs all possible rearrangements of the letters in that string. The arrangements may be output in any order.

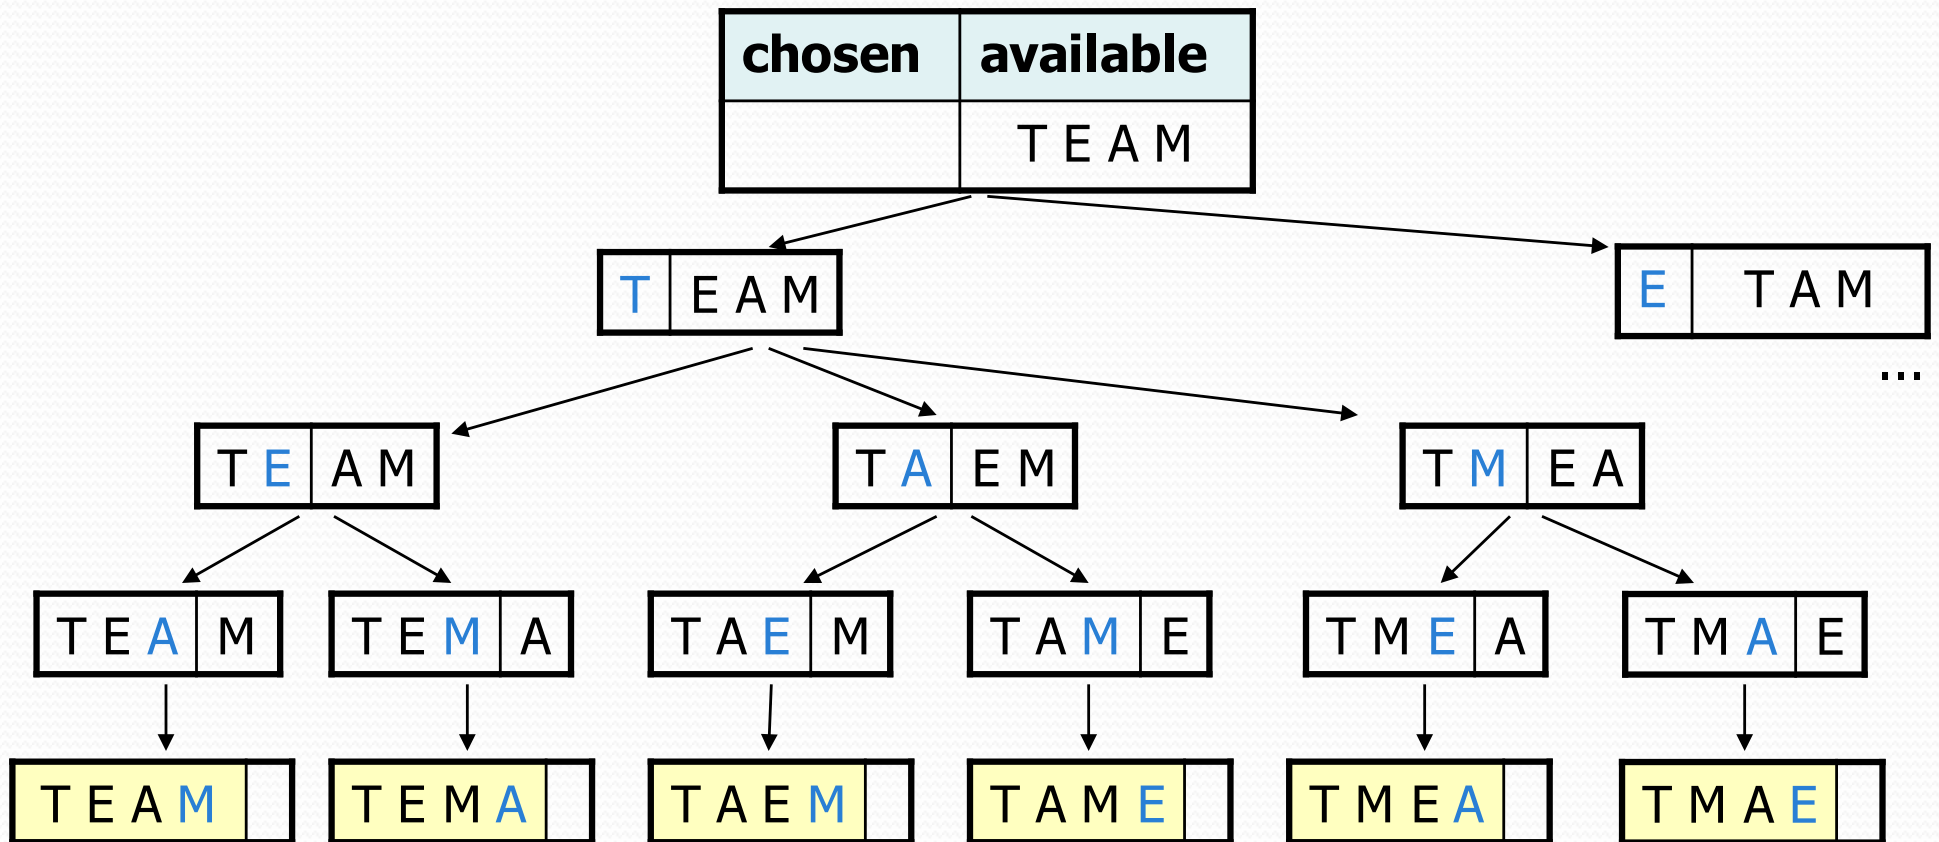

- Example:
`permute("TEAM")`
outputs the following
sequence of lines:

TEAM	ATEM
TEMA	ATME
TAEM	AETM
TAME	AEMT
TMEA	AMTE
TMAE	AMET
ETAM	MTEA
ETMA	MTAE
EATM	META
EAMT	MEAT
EMTA	MATE
EMAT	MAET

Examining the problem

- We want to generate all possible sequences of letters.
 - for (each possible first letter):
 - for (each possible second letter):
 - for (each possible third letter):
 - ...
 - print!
- Each permutation is a set of choices or **decisions**:
 - Which character do I want to place first?
 - Which character do I want to place second?
 - ...
 - **solution space**: set of all possible sets of decisions to explore

Decision tree

Exercise solution

```
// Outputs all permutations of the given string.
public static void permute(String s) {
    permute(s, "");
}

private static void permute(String s, String chosen) {
    if (s.length() == 0) {
        // base case: no choices left to be made
        System.out.println(chosen);
    } else {
        // recursive case: choose each possible next letter
        for (int i = 0; i < s.length(); i++) {
            char c = s.charAt(i); // choose
            s = s.substring(0, i) + s.substring(i + 1);
            chosen += c;

            permute(s, chosen); // explore

            s = s.substring(0, i) + c + s.substring(i);
            chosen = chosen.substring(0, chosen.length() - 1);
            // un-choose
        }
    }
}
```

Exercise solution 2

```
// Outputs all permutations of the given string.
public static void permute(String s) {
    permute(s, "");
}

private static void permute(String s, String chosen) {
    if (s.length() == 0) {
        // base case: no choices left to be made
        System.out.println(chosen);
    } else {
        // recursive case: choose each possible next letter
        for (int i = 0; i < s.length(); i++) {
            String ch = s.substring(i, i + 1); // choose
            String rest = s.substring(0, i) + // remove
                s.substring(i + 1);
            permute(rest, chosen + ch); // explore
        }
    }
    // (don't need to "un-choose" because
    // we used temp variables)
}
```

Backtracking

- Useful to solve problems that require making decisions
 - Each decision leads to new choices
 - Some (but not all!) sequence(s) of choices will be a solution
 - Insufficient information to make a thoughtful choice
- Systematically prune out infeasible solutions

Backtracking strategies

- When solving a backtracking problem, ask these questions:
 - What are the "choices" in this problem?
 - What is the "base case"? (How do I know when I'm out of choices?)
 - How do I "make" a choice?
 - Do I need to create additional variables to remember my choices?
 - Do I need to modify the values of existing variables?
 - How do I explore the rest of the choices?
 - Do I need to remove the made choice from the list of choices?
 - Once I'm done exploring, what should I do?
 - How do I "un-make" a choice?

Maze class

```
#####  
#       #  
#   ##  ## #  
# #     # #  
# #  # # #  
# ## #####  
# #       #  
# # #   # #  
#####  
#       #  
# #     # #  
#####
```

- Suppose we have a `Maze` class with these methods:

Method/Constructor	Description
<code>public Maze(String text)</code>	construct a given maze
<code>public int getHeight(), getWidth()</code>	get maze dimensions
<code>public boolean isExplored(int r, int c)</code> <code>public void setExplored(int r, int c)</code>	get/set whether you have visited a location
<code>public void isWall(int r, int c)</code>	whether given location is blocked by a wall
<code>public void mark(int r, int c)</code> <code>public void isMarked(int r, int c)</code>	whether given location is marked in a path
<code>public String toString()</code>	text display of maze

Exercise: solve maze

- Write a method `solveMaze` that accepts a `Maze` and a starting row/column as parameters and tries to find a path out of the maze starting from that position.
 - If you find a solution:
 - Your code should **stop** exploring.
 - You should **mark** the path out of the maze on your way back out of the recursion, using backtracking.
 - (As you explore the maze, squares you set as 'explored' will be printed with a dot, and squares you 'mark' will display an X.)

```
#####  
#      xx  #  
#  ###x##  #  
#  # xx  #  #  
#  # x#  #  #  
#  ##x#####  
#  #.xx  #  
#  #.#x  #  #  
#####x#####  
#...#xxxx?  
#.#...xx#.#  
#####
```

0123456789

```

0 #####
1 #      #
2 # ###  ##
3 # #    ##
4 # #   ##
5 # ##  #####
6 # #    #
7 # # #  ##
8 #####  #####
9 #   #
0 # #    ##
1 #####

```

choices

(these never change)

Recall: Backtracking

A general pseudo-code algorithm for backtracking problems:

Explore(**choices**):

- if there are no more **choices** to make: stop.
- else, for each available choice **C**:
 - Choose **C**.
 - Explore the remaining **choices**.
 - Un-choose **C**, if necessary. (backtrack!)

What are the choices in this problem?
