

### Exercise: Dice roll sum

 Write a method diceSum similar to diceRoll, but it also accepts a desired sum and prints only arrangements that add up to exactly that sum.

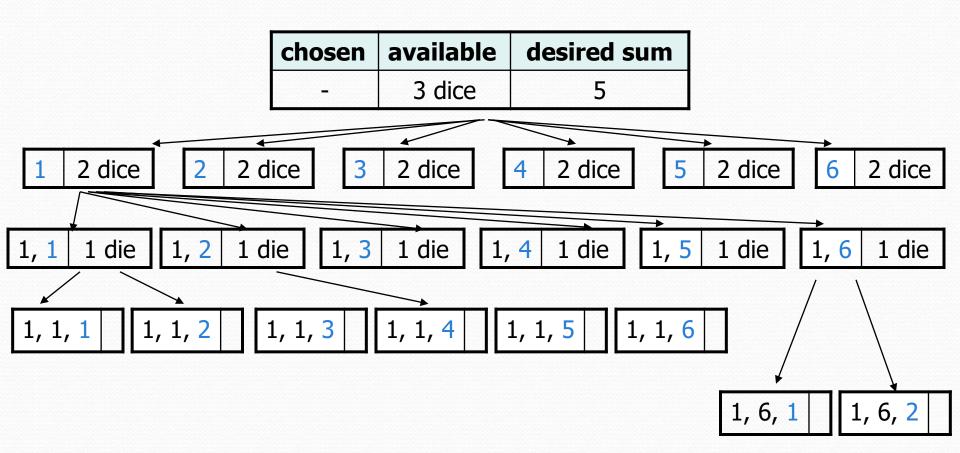

```
diceSum(2, 7);

[1, 6]
[2, 5]
[3, 4]
[4, 3]
[5, 2]
[6, 1]
```

```
diceSum(3, 7);
     [1, 1, 5]
     [1, 2, 4]
     [1, 3, 3]
     [1, 4, 2]
     [1, 5, 1]
     [2, 1, 4]
     [2, 2, 3]
     [2, 3, 2]
     [2, 4, 1]
     [3, 1, 3]
     [3, 2, 2]
     [3, 3, 1]
     [4, 1, 2]
     [4, 2, 1]
     [5, 1, 1]
```

# Consider all paths?

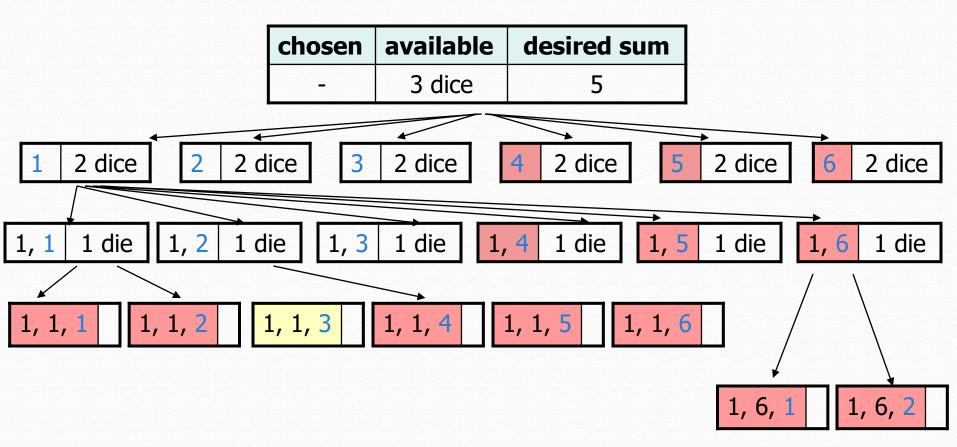

...

## Optimizations

- We need not visit every branch of the decision tree.
  - Some branches are clearly not going to lead to success.
  - We can preemptively stop, or prune, these branches.
- Inefficiencies in our dice sum algorithm:
  - Sometimes the current sum is already too high.
    - (Even rolling 1 for all remaining dice would exceed the sum.)
  - Sometimes the current sum is already too low.
    - (Even rolling 6 for all remaining dice would not reach the sum.)
  - When finished, the code must compute the sum every time.
    - (1+1+1=..., 1+1+2=..., 1+1+3=..., 1+1+4=..., ...)

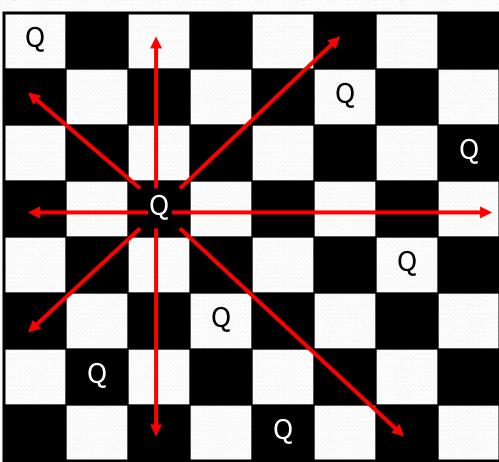

#### New decision tree

# The "8 Queens" problem

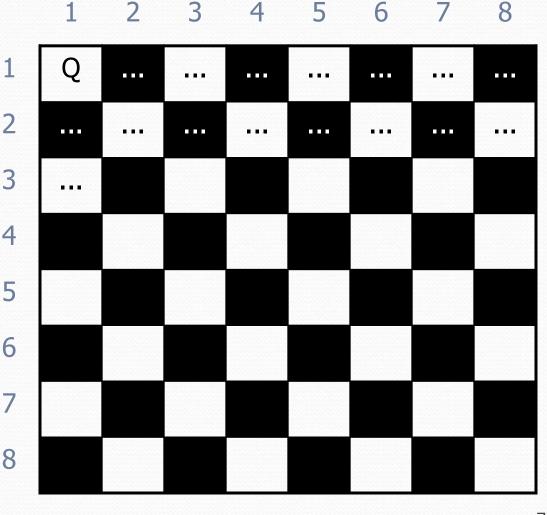

- Consider the problem of trying to place 8 queens on a chess board such that no queen can attack another queen.
  - What are the "choices"?
  - How do we "make" or "un-make" a choice?
  - How do we know when to stop?

## Naive algorithm

- for (each square on board):
  - Place a queen there.
  - Try to place the rest of the queens.
  - Un-place the queen.

- How large is the solution space for this algorithm?
  - 64 \* 63 \* 62 \* ...

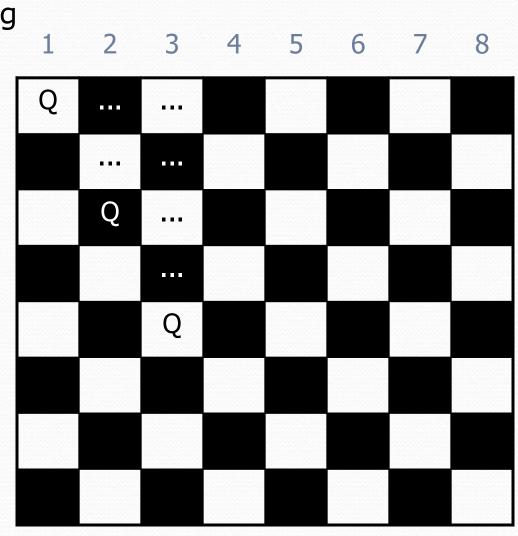

## Better algorithm idea

3

5

- Observation: In a working solution, exactly 1 queen must appear in each row and in each column.
  - Redefine a "choice" to be valid placement of a queen in a particular column.
  - How large is the solution space now?
    - · 8 \* 8 \* 8 \* ...

#### Exercise

• Suppose we have a Board class with these methods:

Method/Constructor	Description
public Board(int size)	construct empty board
public boolean <b>safe</b> (int row, int column)	true if queen can be safely placed here
public void <b>place</b> (int row, int column)	place queen here
public void <b>remove</b> (int row, int column)	remove queen from here
<pre>public void print()</pre>	displays the board

- Write a method solve that accepts a Board as a parameter and tries to place 8 queens on it safely.
  - Your method should find all solutions.
