- Stacks
- Queues
- Sets
- Maps
- Priority Queues

**Java Collections**
- Arrays
- ArrayList
- LinkedList
- Stack
- TreeSet / TreeMap
- HashSet / HashMap
- PriorityQueue
Two Not-so-Similar Problems
Exercise: fourAB

• Write a method `fourAB` that prints out all strings of length 4 composed only of a’s and b’s

• Example Output

<table>
<thead>
<tr>
<th>aaaa</th>
<th>baaa</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaab</td>
<td>baab</td>
</tr>
<tr>
<td>aaba</td>
<td>baba</td>
</tr>
<tr>
<td>aabb</td>
<td>babb</td>
</tr>
<tr>
<td>abaa</td>
<td>bbaa</td>
</tr>
<tr>
<td>abab</td>
<td>bbab</td>
</tr>
<tr>
<td>abab</td>
<td>bbba</td>
</tr>
<tr>
<td>abba</td>
<td>bbbb</td>
</tr>
</tbody>
</table>
• Suppose we had the following method:

```java
public static void mystery(String soFar) {
    if (soFar.length() == 3) {
        System.out.println(soFar);
    } else {
        mystery(soFar + "d");
        mystery(soFar + "a");
        mystery(soFar + "b");
    }
}
```

• What is the **fourth** line of output of the call `mystery(""");`?
• This means you can stop once you’ve found 4 lines of output
Exercise: Dice rolls

- Write a method `diceRoll` that accepts an integer parameter representing a number of 6-sided dice to roll, and output all possible arrangements of values that could appear on the dice.

```
diceRoll(2);
[1, 1]
[1, 2]
[1, 3]
[1, 4]
[1, 5]
[1, 6]
[2, 1]
[2, 2]

A decision tree

<table>
<thead>
<tr>
<th>chosen</th>
<th>available</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>4 dice</td>
</tr>
</tbody>
</table>

1 3 dice

1, 1 2 dice

1, 1, 1 1 die

1, 1, 1, 1

1, 1, 1, 2

1, 1, 1, 3

1, 1, 3, 1

2 3 dice

1, 2 2 dice

1, 2, 2 dice

1, 2, 3 dice

1, 4 2 dice

1, 4, 1 1 die

1, 4, 1

...
Examining the problem

- We want to generate all possible sequences of values.
  for (each possible first die value):
    for (each possible second die value):
      for (each possible third die value):
        ...
        print!

- This is called a **depth-first search**

- How can we completely explore such a large search space?
Solving recursively

- Pick a value for the first die
- Recursively find values for the remaining dice
- Repeat with other values for the first die
- What is the base case?
Private helpers

- Often the method doesn't accept the parameters you want.
  - So write a **private helper** that accepts more parameters.
  - Extra params can represent current state, choices made, etc.

```csharp
public int methodName(params):
  ...
  return helper(params, moreParams);

private int helper(params, moreParams):
  ...
  (use moreParams to help solve the problem)
```
Exercise solution

// Prints all possible outcomes of rolling the given
// number of six-sided dice in [#, #, #] format.
public static void diceRolls(int dice) {
    List<Integer> chosen = new ArrayList<Integer>();
    diceRolls(dice, chosen);
}

// private recursive helper to implement diceRolls logic
private static void diceRolls(int dice, List<Integer> chosen) {
    if (dice == 0) {
        System.out.println(chosen);   // base case
    } else {
        for (int i = 1; i <= 6; i++) {
            chosen.add(i);               // choose
diceRolls(dice - 1, chosen);   // explore
            chosen.remove(chosen.size() - 1); // un-choose
        }
    }
}
Backtracking

- **backtracking**: Finding solution(s) by trying partial solutions and then abandoning them if they are not suitable.
  - a "brute force" algorithmic technique (tries all paths)
  - often implemented recursively

Applications:
- producing all permutations of a set of values
- parsing languages
- games: anagrams, crosswords, word jumbles, 8 queens
- combinatorics and logic programming
Backtracking algorithms

A general pseudo-code algorithm for backtracking problems:

Explore(\textbf{choices}):  
\begin{itemize}  
    \item if there are no more \textbf{choices} to make: stop.  
    \item else:  
        \begin{itemize}  
            \item Make a single choice $C$.  
            \item Explore the remaining \textbf{choices}.  
            \item Un-make choice $C$, if necessary.  
        \end{itemize}  
\end{itemize}  
(backtrack!)
Backtracking strategies

- When solving a backtracking problem, ask these questions:
  - What are the "choices" in this problem?
    - What is the "base case"? (How do I know when I'm out of choices?)
  - How do I "make" a choice?
    - Do I need to create additional variables to remember my choices?
    - Do I need to modify the values of existing variables?
  - How do I explore the rest of the choices?
    - Do I need to remove the made choice from the list of choices?
  - Once I'm done exploring, what should I do?
  - How do I "un-make" a choice?
Exercise: Dice roll sum

- Write a method `diceSum` similar to `diceRoll`, but it also accepts a desired sum and prints only arrangements that add up to exactly that sum.

```plaintext
diceSum(2, 7);
[1, 6]
[2, 5]
[3, 4]
[4, 3]
[5, 2]
[6, 1]
diceSum(3, 7);
[1, 1, 5]
[1, 2, 4]
[1, 3, 3]
[1, 4, 2]
[1, 5, 1]
[2, 1, 4]
[2, 2, 3]
[2, 3, 2]
[2, 4, 1]
[3, 1, 3]
[3, 2, 2]
[3, 3, 1]
[4, 1, 2]
[4, 2, 1]
[5, 1, 1]
```
Consider all paths?

<table>
<thead>
<tr>
<th>chosen</th>
<th>available</th>
<th>desired sum</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>3 dice</td>
<td>5</td>
</tr>
</tbody>
</table>

1, 1       2 dice
1, 2       2 dice
1, 3       2 dice
1, 4       2 dice
1, 5       2 dice
1, 6       2 dice

1, 1, 1
1, 1, 2
1, 1, 3
1, 1, 4
1, 1, 5
1, 1, 6

1, 6, 1
1, 6, 2
...
Optimizations

• We need not visit every branch of the decision tree.
  • Some branches are clearly not going to lead to success.
  • We can preemptively stop, or prune, these branches.

• Inefficiencies in our dice sum algorithm:
  • Sometimes the current sum is already too high.
    • (Even rolling 1 for all remaining dice would exceed the sum.)
  • Sometimes the current sum is already too low.
    • (Even rolling 6 for all remaining dice would not reach the sum.)
  • When finished, the code must compute the sum every time.
    • (1+1+1 = ..., 1+1+2 = ..., 1+1+3 = ..., 1+1+4 = ..., ...)
New decision tree

<table>
<thead>
<tr>
<th>chosen</th>
<th>available</th>
<th>desired sum</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>3 dice</td>
<td>5</td>
</tr>
</tbody>
</table>

```
1  | 2 dice

1, 1 | 1 die
1, 1, 1

1, 2 | 1 die
1, 1, 2

1, 3 | 1 die
1, 1, 3

1, 4 | 1 die
1, 1, 4

1, 5 | 1 die
1, 1, 5

1, 6 | 1 die
1, 1, 6

...```
Exercise: Combinations

- Write a method `combinations` that accepts a string `s` and an integer `k` as parameters and outputs all possible `k`-letter words that can be formed from unique letters in that string. The arrangements may be output in any order.

- Example:
  
  ```java
  combinations("GOOGLE", 3)
  ```

  outputs the sequence of lines at right.

- To simplify the problem, you may assume that the string `s` contains at least `k` unique characters.
Initial attempt

class Solution {
    public static void combinations(String s, int length) {
        combinations(s, "", length);
    }

    private static void combinations(String s, String chosen, int length) {
        if (length == 0) {
            System.out.println(chosen); // base case: no choices left
        } else {
            for (int i = 0; i < s.length(); i++) {
                String ch = s.substring(i, i + 1);
                if (!chosen.contains(ch)) {
                    String rest = s.substring(0, i) + s.substring(i + 1);
                    combinations(rest, chosen + ch, length - 1);
                }
            }
        }
    }
}

- Problem: Prints same string multiple times.
Exercise solution

public static void combinations(String s, int length) {
    Set<String> all = new TreeSet<String>();
    combinations(s, "", all, length);
    for (String comb : all) {
        System.out.println(comb);
    }
}

private static void combinations(String s, String chosen, Set<String> all, int length) {
    if (length == 0) {
        all.add(chosen); // base case: no choices left
    } else {
        for (int i = 0; i < s.length(); i++) {
            String ch = s.substring(i, i + 1);
            if (!chosen.contains(ch)) {
                String rest = s.substring(0, i) + s.substring(i + 1);
                combinations(rest, chosen + ch, all, length - 1);
            }
        }
    }
}
