

## Lecture 4 Activity

Consider the following (simplified) HTML body:

```
<body>
  <header>
    <h1>Heading!</h1>
  </header>
  <main>
    <p>A paragraph!</p>
    <ol>
      <li>Some text</li>
      <li>
        <ul>
          <li>Sub-bullet item</li>
          <li>Sub-bullet item</li>
        </ul>
      </li>
      <li>
        Item with a link to
        <a href="https://imgur.com/r/puppies">puppy photos</a>
      </li>
    </ol>
  </main>
</body>
```

If we were to represent this as a tree of parent/child relationships, we might start with the following “root” at the top (with branches going downwards). How would you finish the tree to complete the HTML representation from above?
