

Examine the following three forms (front and back of this page) that accept input from a user and, when the user hits a “submit” button, sends information to a server for processing. For each, write down next to them your thoughts for each of the following questions based on your prior experience with forms on other websites:

- What fields must be filled in?
- What fields need a specific type of data entered into them?
- For fields that take numbers: what range of numbers might be ok? What would not be ok?
- What other types of “input validation” might you need to do for this form?
- Circle the fields that are asking for information that should be kept secure (both in transport to the server and once it is kept by the server)?
- Put a star next to the fields where information should be validated (using JavaScript) before the request.
- Put a checkmark next to the fields where information should be validated after the request (with server side programming)?
