Dictionaries

Ruth Anderson

UW CSE 160

Spring 2018

Dictionaries or mappings

- A dictionary maps each *key* to a *value*
- Order does not matter
- Given a key, can look up a value
  - Given a value, cannot look up its key
- **No duplicate keys**
  - Two or more keys may map to the same value
- *Keys* and *values* are Python values
  - **Keys** must be **immutable** (not a list, set, or dict)
- Can add *key* → *value* mappings to a dictionary
  - Can also remove (less common)

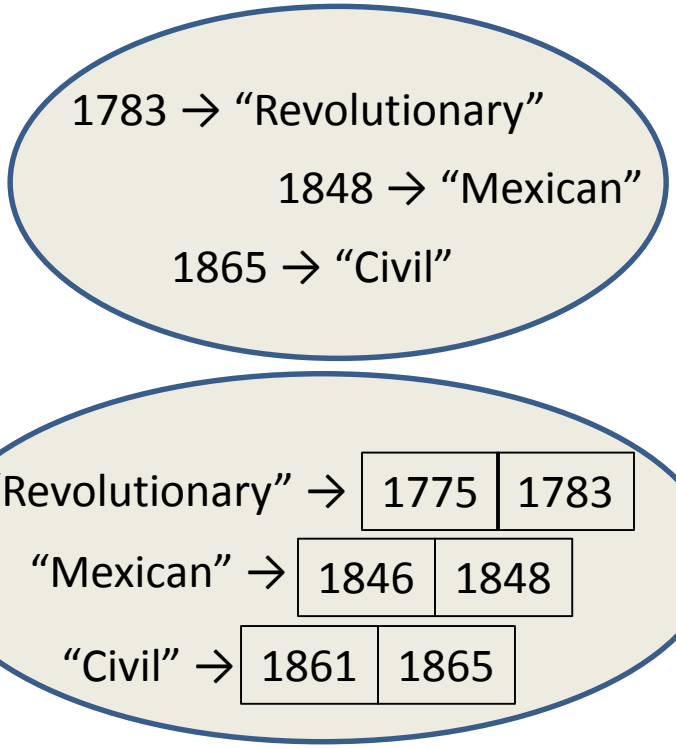
Dictionary syntax in Python

```
d = { }
d = dict()
```

Two different ways to create an empty dictionary

```
us_wars_by_end = {
  1783: "Revolutionary",
  1848: "Mexican",
  1865: "Civil" }
us_wars_by_name = {
  "Civil" : [1861, 1865],
  "Mexican" : [1846, 1848],
  "Revolutionary" : [1775, 1783]
}
```

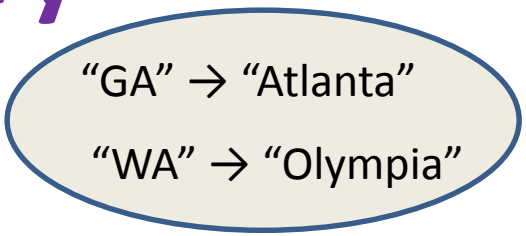


- Syntax just like lists, for accessing and setting:

```
us_wars_by_end[1783]    ⇒
us_wars_by_end[1783][1:10]    ⇒
us_wars_by_name["WWI"] = [1917, 1918]
```

See in python tutor

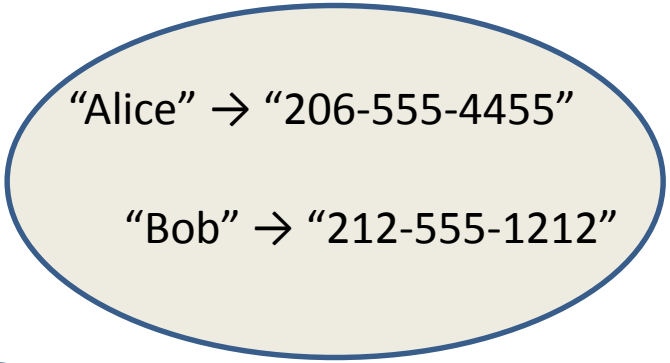
Creating a dictionary

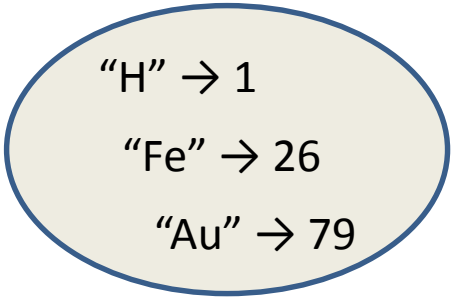


```
>>> state_capitals = {"GA" : "Atlanta", "WA": "Olympia" }

>>> phonebook = dict()
>>> phonebook["Alice"] = "206-555-4455"
>>> phonebook["Bob"] = "212-555-2211"

>>> atomic_number = {}
>>> atomic_number["H"] = 1
>>> atomic_number["Fe"] = 26
>>> atomic_number["Au"] = 79
```





See in python tutor

Accessing a dictionary

```
>>> atomic_number = {"H":1, "Fe":26, "Au":79}
>>> atomic_number["Au"]
79
>>> atomic_number["B"]
Traceback (most recent call last):
  File "<pyshell#102>", line 1, in <module>
    atomic_number["B"]
KeyError: 'B'
>>> atomic_number.has_key("B")
False
>>> atomic_number.keys()
['H', 'Au', 'Fe']
>>> atomic_number.values()
[1, 79, 26]
>>> atomic_number.items()
[('H', 1), ('Au', 79), ('Fe', 26)]
```

"H" → 1

"Fe" → 26

"Au" → 79

Good for iteration (for loops)

```
for key in mymap.keys():
  val = mymap[key]
  … use key and val

for key in mymap:
  val = mymap[key]
  … use key and val

for (key,val) in mymap.items():
  … use key and val
```

See in python tutor

Iterating through a dictionary

```
atomic_number = {"H":1, "Fe":26, "Au":79}

# Print out all the keys:
for element_name in atomic_number.keys():
    print element_name

# Another way to print out all the keys:
for element_name in atomic_number:
    print element_name

# Print out all the values:
for element_number in atomic_number.values():
    print element_number

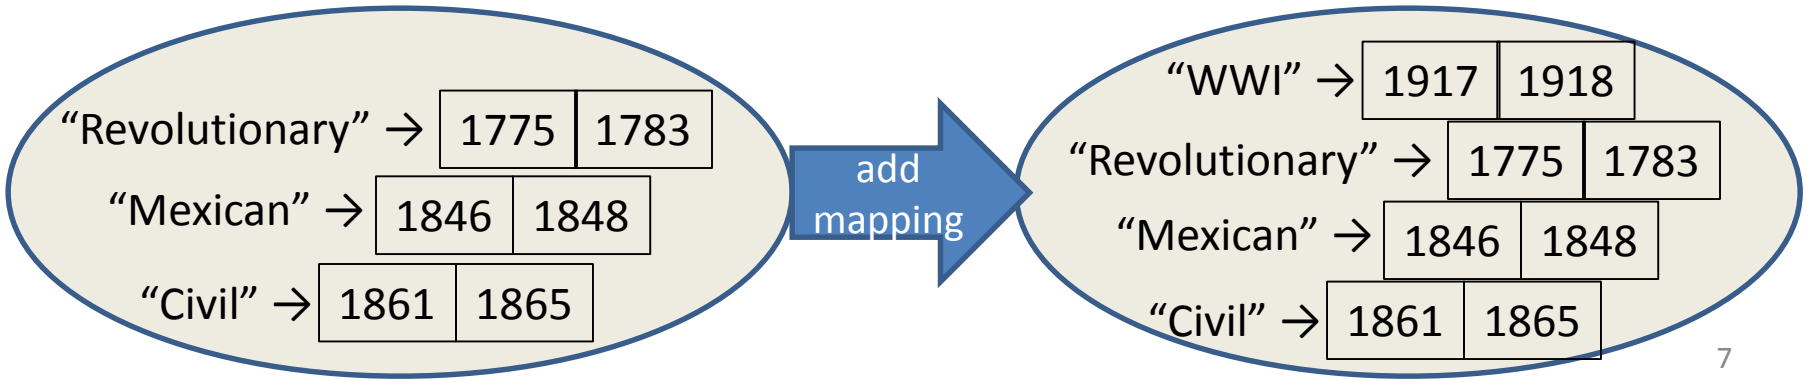
# Print out the keys and the values
for (element_name, element_number) in atomic_number.items():
    print "name:", element_name, "number:", element_number
```

See in python tutor

Modifying a dictionary

```
us_wars1 = {
    "Revolutionary" : [1775, 1783],
    "Mexican" : [1846, 1848],
    "Civil" : [1861, 1865] }
```

```
us_wars1["WWI"] = [1917, 1918]   # add mapping
del us_wars1["Civil"]   # remove mapping
```



Dictionary Exercises

- What does this do?

```
squares = { 1:1, 2:4, 3:9, 4:16 }
squares[3] + squares[3]
squares[3 + 3]
squares[2] + squares[2]
squares[2 + 2]
```

- Convert a list to a dictionary:
  - Given [5, 6, 7], produce {5:25, 6:36, 7:49}
- Reverse key with value in a dictionary:
  - Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}

Dictionary Exercise (Answers)

- Convert a list to a dictionary:
  - E.g. Given [5, 6, 7], produce {5:25, 6:36, 7:49}

```
d = {}
for i in [5, 6, 7]:  # or range(5, 8)
    d[i] = i * i
```

- Reverse key with value in a dictionary:
  - E.g. Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}

```
k ={}
for i in d.keys():
    k[d[i]] = i
```

A list is like a dictionary

- A list maps an integer to a value
  - The integers must be a continuous range 0..*i*

```
mylist = ['a', 'b', 'c']
mylist[1] ⇒ 'b'
mylist[3] = 'c'    # error!
```

- In what ways is a list more convenient than a dictionary?
- In what ways is a list less convenient than a dictionary?

Not every value is allowed to be a key in a dictionary

- Keys must be **immutable** values
  - int, float, bool, string, *tuple of immutable types*
  - *not*: list, set, dictionary
- The dictionary itself is **mutable** (e.g. we can add and remove elements)
- **Goal**: only dictionary operations change the keyset
  - after "`mydict[x] = y`", `mydict[x]` ⇒ y
  - if `a == b`, then `mydict[a] == mydict[b]`

  These conditions should hold until `mydict` is changed
- **Mutable keys can violate these goals**
