

Graphs

Ruth Anderson

UW CSE 160

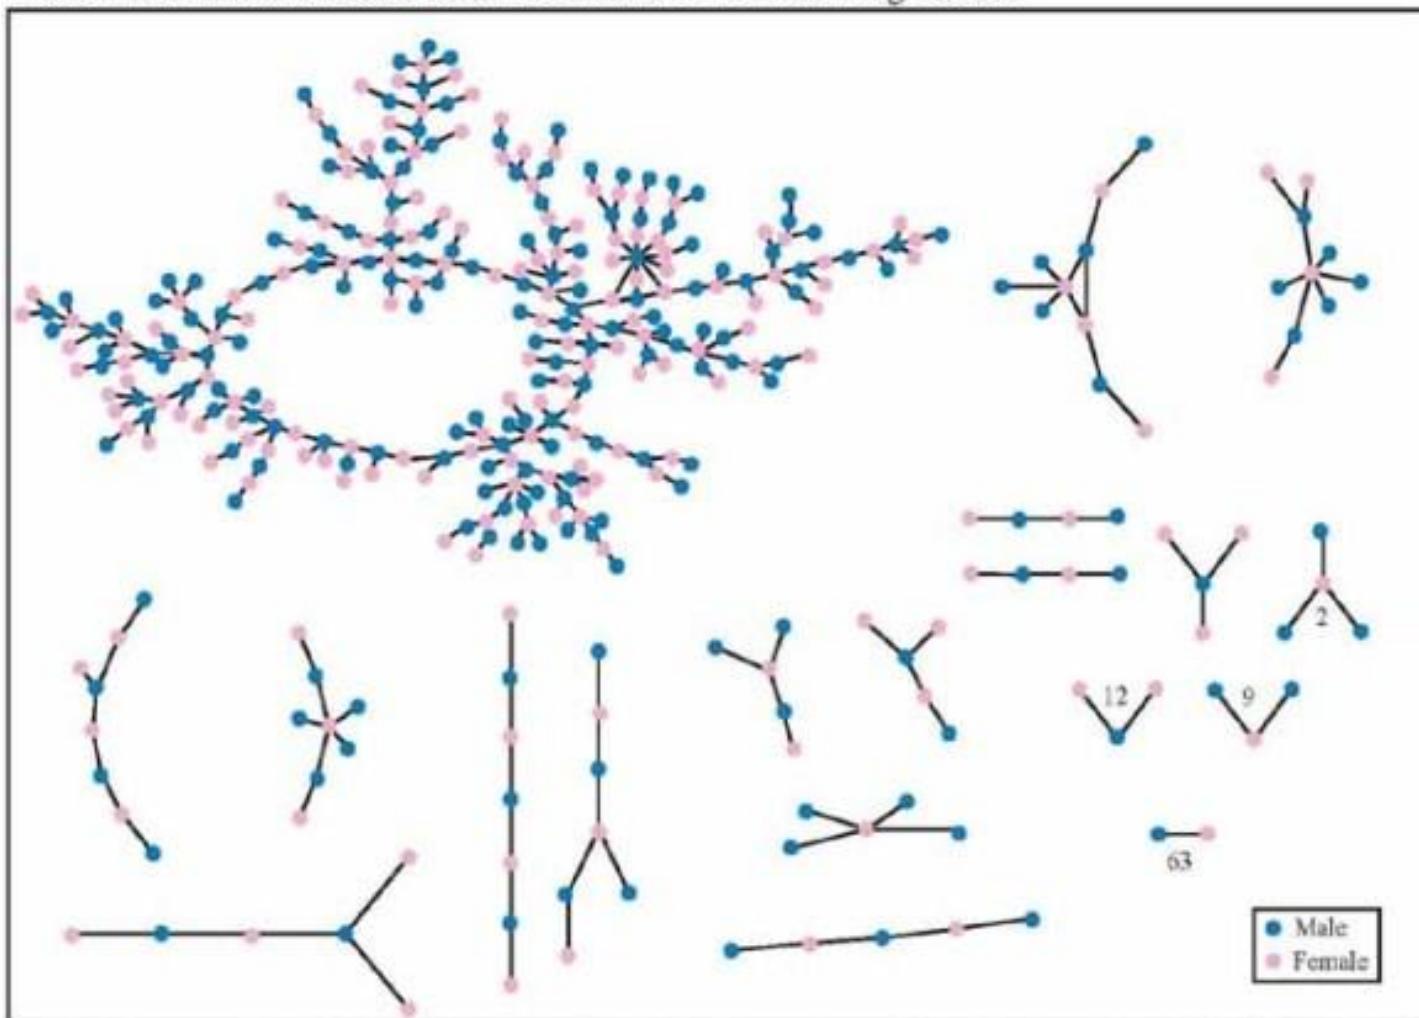

Autumn 2020

A graph contains nodes and edges

The Structure of Romantic and Sexual Relations at "Jefferson High School"

+ 350 students in no romantic and/or sexual relationship

From: "Chains of Affection: The Structure of Adolescent Romantic and Sexual Networks",
American Journal of Sociology, by Peter Bearman of (Columbia), James Moody (Ohio State),
and Katherine Stovel (U. of Washington);

Graphs

- A graph can be thought of as either of:
 - a collection of edges
 - Each edge represents some relationship
 - for each node, a collection of neighbors
 - The neighbors are those connected by an edge

Operations on a graph

Creation:

- Create an empty graph

Querying:

- Look up a node: Does it exist? What are its neighbors?
- Look up an edge (= a pair of nodes): does it exist? (You know the nodes it connects.)
- Iterate through the nodes or edges

Modification:

- Add/remove a node
- Add/remove an edge

networkx Graph Library

- Used in Homework 4
- Included in the Anaconda Distribution
- <https://networkx.github.io/documentation/stable/tutorial.html>

```
import networkx as nx
g = nx.Graph()
g.add_node(1)
g.add_node(2)
g.add_edge(1, 2)
print(g.nodes())
print(g.edges())
```

Note: It is also o.k. to just add an edge before you add the individual nodes; the nodes will be added for you in that case.

```
import networkx as nx
import matplotlib.pyplot as plt

g = nx.Graph()          # Creates a graph

g.add_edge(1, 2)         # Adds edge from node 1 to node 2
g.add_edge(1, 3)
g.add_node(4)            # Adds node 4
print("Edges:", g.edges())
print("Nodes:", g.nodes())
print("Neighbors of node 1:", list(g.neighbors(1)))

assert len(g.nodes()) == 4
assert len(g.edges()) == 2

nx.draw_networkx(g)     # Draw the graph
plt.show()               # Show the graph
```
