List comprehensions

Rob Thompson UW CSE 160 Winter 2021

Three Ways to Define a List

- Explicitly write out the whole thing:
 squares = [0, 1, 4, 9, 16, 25, 36, 49, 64, 81, 100]
- Write a loop to create it:
 squares = []
 for i in range(11):
 squares.append(i * i)
- Write a list comprehension:
 squares = [i * i for i in range(11)]
- A list comprehension is a concise description of a list
- A list comprehension is shorthand for a loop

Two ways to convert Centigrade to Fahrenheit

ctemps = [17.1, 22.3, 18.4, 19.1]

```
With a loop:
```

```
ftemps = []
for c in ctemps:
    f = celsius_to_farenheit(c)
    ftemps.append(f)
```

With a list comprehension:

ftemps = [celsius_to_farenheit(c) for c in ctemps]

The comprehension is usually shorter, more readable, and more efficient

Syntax of a comprehension

Semantics of a comprehension

result =

```
[(x, y) for x in seq1 for y in seq2 if sim(x, y) > threshold]
result = []
for x in seq1:
   for y in seq2:
      if sim(x, y) > threshold:
        result.append((x, y))
... use result ...
```

Types of comprehensions

List

[i * 2 for i in range(3)]

Set

{i * 2 for i in range(3)} Dictionary

{ key: value for item in sequence ...}
{i: i * 2 for i in range(3) }

Cubes of the first 10 natural numbers Goal:

Produce: [0, 1, 8, 27, 64, 125, 216, 343, 512, 729]

With a loop:

```
cubes = []
for x in range(10):
    cubes.append(x ** 3)
```

With a list comprehension:

cubes = [x ** 3 for x in range(10)]

Powers of 2: (2⁰ through 2¹⁰)

Goal: [1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024]

powers = [2 ** i for i in range(11)]

Lengths of elements of a list

Goal: Write a list comprehension that computes the length of each string in the list colors.

colors = ["red", "blue", "purple", "gold", "orange"]
lengths = [**your expression goes here**]

 \Rightarrow [3, 4, 6, 4, 6]

Even elements of a list

Goal: Given an input list **nums**, produce a list of the even numbers in **nums**

nums = [3, 1, 4, 1, 5, 9, 2, 6, 5]evens = [**your expression goes here**] $\Rightarrow [4, 2, 6]$

Dictionary of squares

Goal: Given an input list nums, produce a dictionary that maps each number to the square of that number.

nums = [3, 1, 4, 5, 9, 2, 6, 7]
square_dict = {**your expression goes here**}

Normalize a list

num_list = [6, 4, 2, 8, 9, 10, 3, 2, 1, 3]
total = sum(num_list)

With a loop:

for i in range(len(num_list)):
 num_list[i] = num_list[i] / total

With a list comprehension:

num_list = [num / total for num in num_list]

Dice Rolls

Goal: A list of all possible dice rolls.

With a loop: rolls = [] for r1 in range(1, 7): for r2 in range(1, 7): rolls.append((r1, r2))

All above-average 2-die rolls

Goal: Result list should be a list of 2-tuples: [(2, 6), (3, 5), (3, 6), (4, 4), (4, 5), (4, 6), (5, 3), (5, 4), (5, 5), (5, 6), (6, 2), (6, 3), (6, 4), (6, 5), (6, 6)]

[(r1, r2) for r1 in range(1, 7)
 for r2 in range(1, 7)
 if r1 + r2 > 7]

OR

[(r1, r2) for r1 in range(1, 7) for r2 in range(8 - r1, 7)]

Sum of above-average 2-die rolls

Goal: Result list should be a list of integers:

[r1 + r2 for r1 in range(1, 7) for r2 in range(1, 7) if r1 + r2 > 7] $\Rightarrow [8, 8, 9, 8, 9, 10, 8, 9, 10, 11, 8, 9, 10, 11, 12]$

```
Remove Duplicates: Use Set Comprehensions

{r1 + r2 \text{ for } r1 \text{ in } range(1, 7)}

for r2 \text{ in } range(1, 7)

if r1 + r2 > 7}

\Rightarrow \{8, 9, 10, 11, 12\}
```

Making a Grid

Goal: A grid were each element is the sum of it's row # and column #.

```
(e.g. [[0, 1, 2], [1, 2, 3]])
```

With a loop:

```
grid = []
for i in range(2):
    row = []
    for j in range(3):
        row.append(i + j)
        grid.append(row)
```

With a list comprehension:

grid = [[i + j for j in range(3)] for i in range(2)]

A word of caution

List comprehensions are great, but they can get confusing. Err on the side of readability.

```
nums = [n for n in range(100) if
            sum([int(j) for j in str(n)]) % 7 == 0]
or
nums = []
for n in range(100):
            digit_sum = sum([int(j) for j in str(n)])
            if digit_sum % 7 == 0:
```

nums.append(n)

A word of caution

List comprehensions are great, but they can get confusing. Err on the side of readability.

```
def sum_digits(n):
    digit_list = [int(i) for i in str(n)]
    return sum(digit_list)
```

```
nums = [n for n in range(100) if
    sum_digits(n) % 7 == 0]
```
