# Lists

---

- **Make a list**
  - `listname = [item0, item1, ..., itemn]`
- **Access an element**
  - `listname[i]` returns the item at index `i`
- **List Slicing**
  - `listname[a : b]` creates a list that contains the elements in between indexes `a` (inclusive) and `b` (exclusive).
- **Length**
  - `len(listname)` will return the number of elements in the list.

W

# Functions that modify lists

- **Append**
  - `listname.append(item)` adds item to the end of the list
- **Insert**
  - `listname.insert(i, item)` puts the item at index i, and moves everything else to the right
- **Extend**
  - `list1.extend(list2)` will combine the contents of list2 to the end of list1
- **Reverse**
  - `listname.reverse()` reverses the order of the list (in-place)
- **Sort**
  - `listname.sort()` sorts the list in ascending order (smallest to greatest) (in-place)

W

Kahoot!

PAUL G. ALLEN SCHOOL  
OF COMPUTER SCIENCE & ENGINEERING

# Question 1

---

Q: Given the following list, what is the index for the value 89?

A: 3

lst = [22, 45, 65, 89, 5]

Index: 0 1 2 3 4

*Remember that we count indices starting at 0*

W

## Question 2

---

Q: What is the output of the following code?

A: 45

*Prints the value at index 1*

```
lst = [22, 45, 65, 89, 5]
print(lst[1])
```

W

# Question 3

---

Q: What is the output of the following code?

A: [45, 65]

*Prints the sublist starting at index 1 and stopping at  
(not including) index 3*

```
lst = [22, 45, 65, 89, 5]
print(lst[1:3])
```

W

# Question 4

---

Q: What is the output of the following code?

A: [22, 45, 65, 89, 999, 5]

```
lst = [22, 45, 65, 89, 5]
lst.insert(4, 999)
print(lst)
```

*Inserts the value 999 before index 4.*

*999 is now at index 4, everything else pushed to the right.*

W

# Question 5

---

Q: What is the output of the following code?

A: [1, 2, 3, 4, 5, 6]

```
lst1 = [1, 2, 3]
lst2 = [4, 5, 6]
lst1.extend(lst2)
print(lst1)
```

*Adds all the values of lst2 to the end of lst1*

W

# Question 6

---

Q: What is the output of the following code?

A: [3, 2, 1]

```
lst = [1, 2, 3]
lst.reverse()
print(lst)
```

*Reverses the contents of the list (in place).*

W

# Question 7

---

Q: What is the output of the following code?

A: [1, 2, 3]

```
lst = [2, 1, 3]
lst.sort()
print(lst)
```

*Sorts the contents of the list in ascending order (in place).*

W

# Section Handout Problems

- We will go over problems 1-3, but solutions for all problems will be posted!
- Great practice - go to OH if you have questions!

# 1. What values would be printed when you run the following lines of code?

```
list_1 = [1, 2, 3, 4, 5]
list_2 = list_1
list_3 = list_1[:] # equivalent to list_1[0:5]
list_2[0] = 98
list_1[4] = 99
print("List 1:", list_1)
print("List 2:", list_2)
print("List 3:", list_3)
```

W

## 2. Given the following, modify list\_1 so it contains numbers 1 through 26 in increasing order:

```
list_1 = [1, 2, 3, 4]
```

```
list_2 = [10, 12]
```

```
list_3 = [21, 22, 23, 24]
```

```
list_4 = [13, 14, 15]
```

```
list_5 = [16, 17, 18, 19, 20, 25, 26]
```

```
list_6 = [9, 8, 7, 6, 5]
```

```
list_7 = [11]
```

a) using only the following operations:

- `list accesses []`
- `extend()`
- `insert()`
- `reverse()`
- `for loop`

W

## 2. Given the following, modify list\_1 so it contains numbers 1 through 26 in increasing order:

```
list_1 = [1, 2, 3, 4]
```

```
list_2 = [10, 12]
```

```
list_3 = [21, 22, 23, 24]
```

```
list_4 = [13, 14, 15]
```

```
list_5 = [16, 17, 18, 19, 20, 25, 26]
```

```
list_6 = [9, 8, 7, 6, 5]
```

```
list_7 = [11]
```

b) using the same operations as in part (a), but this time you are allowed to use the `sort()` function.

[Python Tutor](#)

W

**3. Create a function `dot_product(list1, list2)` which takes in two lists of integers and returns their dot product.**

---

```
def dot_product(list1, list2):
```

W

Thanks :)
