```
# if/elif/else syntax
if condition1:
    # statements
elif condition2:
    # other statements
else:
    # more statements
```

  

```
# for Loop syntax
for i in sequence:
    # statements
```

  

```
# function definition syntax
def function_name(param1, param2, ...):
    # statements
```

Function	Description
<code>range([start,] stop [, step])</code>	Returns a sequence of numbers from <b>start</b> (inclusive) to <b>stop</b> (exclusive) incremented by <b>step</b>
<code>len(Lst)</code>	Returns the number of elements in <b>Lst</b>

## Lists

Function	Description
<code>lst = []</code>	Creates an empty list
<code>lst[idx]</code>	Returns the element in <b>Lst</b> at index <b>idx</b>
<code>lst[start : end]</code>	Returns a sublist of <b>Lst</b> from index <b>start</b> to index <b>end</b> (exclusive)
<code>lst[start : end : step]</code>	Returns a sublist of <b>Lst</b> from index <b>start</b> to index <b>end</b> (exclusive), incrementing by <b>step</b>
<code>lst.append(elmt)</code>	Adds the element <b>elmt</b> to the end of <b>Lst</b> . Returns <code>None</code> .
<code>lst.index(elmt)</code>	Returns index of the first occurrence of <b>elmt</b> in <b>Lst</b> , Error if <b>elmt</b> is not in <b>lst</b>
<code>lst.count(elmt)</code>	Returns the number of times <b>elmt</b> occurs in <b>Lst</b>
<code>lst.remove(elmt)</code>	Removes first occurrence of <b>elmt</b> from <b>Lst</b> , Error if <b>elmt</b> is not in <b>Lst</b> . Returns <code>None</code> .
<code>lst.pop(idx)</code> <code>lst.pop()</code>	Removes and returns the element at index <b>idx</b> in <b>Lst</b> . With no parameter, removes the last element in <b>Lst</b>
<code>lst.insert(idx, elmt)</code>	Inserts an element <b>elmt</b> in list at index <b>idx</b> . Returns <code>None</code> .

## File I/O

Function	Description
<code>my_file = open(<i>filepath</i>)</code>	Opens the file with given <i>filepath</i> for reading, returns a file object
<code>my_file.close()</code>	Closes file <code>my_file</code>

```
# Process one line at a time:      # Process entire file at once
for line_of_text in my_file:      all_data_as_a_big_string = my_file.read()
    # process line_of_text
```

## Sorting

Function	Description
<code>sorted(<i>collection</i> [,key=<i>sort_key</i>, reverse=<i>bool_val</i>])</code>	Returns a sorted copy of <i>collection</i> , based on optional sort key ( <i>key</i> ) and optional order preference ( <i>reverse</i> )
<code><i>lst</i>.sort( [key=<i>sort_key</i>, reverse=<i>bool_val</i>] )</code>	Sorts the given list <i>lst</i> , based on optional sort key ( <i>key</i> ) and optional order preference ( <i>reverse</i> ), and returns <code>None</code>

## Common Error Names

`IndexError` – Index out of range

`KeyError` – Key not found in dictionary

`IndentationError` – Invalid indentation

`TypeError` – Operation applied to invalid combination of types

`ValueError` – Function gets properly typed argument, but invalid value

`SyntaxError` – Invalid Python syntax

`NameError` – Variable name not found

`FloatingPointError` – Floating point operation fails

`RuntimeError` – Otherwise Unknown Error
