Motivation

- want to be able to style individual elements, groups of elements, sections of text or of the page
- want to create **complex page layouts**

CSS Box Model

- for layout purposes, every element is composed of:
 - the actual element's **content**
 - a **border** around the element
 - **padding** between the content and the border (*inside*)
 - a **margin** between the border and other content (*outside*)
- width = content width + L/R padding + L/R border + L/R margin
- height = content height + T/B padding + T/B border + T/B margin
- IE6 doesn't do this right, and sucks

Document flow - block elements

```
<html>
  <head>...</head>
  <body>
    <h1>...</h1>
    <h2>...</h2>
    <p>...</p>
    <h2>...</h2>
    <p>...</p>
    <p>...</p>
    <p>...</p>
  </body>
</html>
```

Each block element is taken in the order it appears in the markup, and placed on the page.

Each new block element causes a linebreak.

Notice that elements take up the full width of the page.

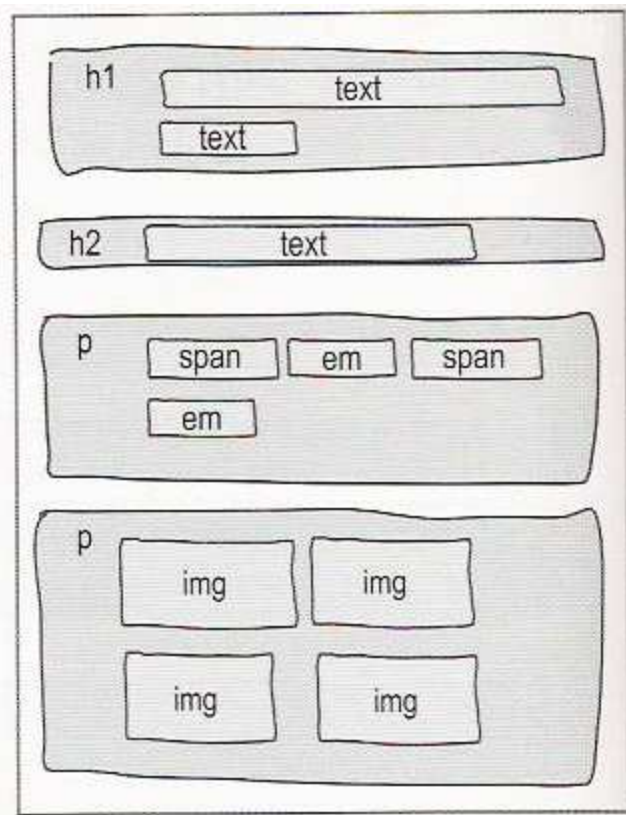

Document flow - inline elements

```
<p>  
Join us <em>any evening</em> for  
these and all our other wonderful <a  
href="beverages/elixir.html" title="Head  
First Lounge Elixirs">elixirs</a>.  
</p>
```

Document flow - a larger example

CSS properties for borders

```
h2 { border: 5px solid red; }
```

CSS

This is a heading.

- border: all properties of border on all 4 sides
- a border is specified as three items:
 - its **thickness** (specified in px, pt, em, or one of the following general widths: `thin`, `medium`, `thick`)
 - its **style** (one of none, hidden, `dotted`, `dashed`, `double`, `groove`, `inset`, `outset`, `ridge`, `solid`)
 - its **color** (specified as seen previously for text and background colors)

More border properties

- border-color, border-width, border-style: specific properties of border on all 4 sides
- border-bottom, border-left, border-right, border-top: all properties of border on a particular side
- border-bottom-color, border-bottom-style, border-bottom-width, border-left-color, border-left-style, border-left-width, border-right-color, border-right-style, border-right-width, border-top-color, border-top-style, border-top-width: specific properties of border on a particular side
- Complete list of border properties

Border example 2

```
h2 {  
  border-left: thick dotted #CC0088;  
  border-bottom-color: rgb(0, 128, 128);  
  border-bottom-style: double;  
}
```

CSS

This is a heading.

- each side's border properties can be set individually
- if you omit some properties, they receive default values (e.g. `border-bottom-width` above)

CSS properties for padding

- padding: padding on all 4 sides
- padding-bottom: padding on bottom side only
- padding-left: padding on left side only
- padding-right: padding on right side only
- padding-top: padding on top side only
- Complete list of padding properties

Padding example 1

```
p { padding: 20px; border: 3px solid black; }  
h2 { padding: 0px; background-color: yellow; }
```

CSS

This is the first paragraph

This is the second paragraph

This is a heading

Padding example 2

```
p {  
  padding-left: 200px; padding-top: 30px;  
  background-color: fuchsia;  
}
```

CSS

This is the first paragraph

This is the second paragraph

-
- each side's padding can be set individually
 - notice that padding shares the background color of the element

CSS properties for margins

- margin: margin on all 4 sides
- margin-bottom: margin on bottom side only
- margin-left: margin on left side only
- margin-right: margin on right side only
- margin-top: margin on top side only
- Complete list of margin properties

Margin example 1

```
p {  
  margin: 70px;  
  background-color: fuchsia;  
}
```

CSS

This is the first paragraph

This is the second paragraph

-
- notice that margins are always transparent
(they don't contain the element's background color, etc.)

Margin example 2

```
p {  
  margin-left: 200px;  
  background-color: fuchsia;  
}
```

CSS

This is the first paragraph

This is the second paragraph

-
- each side's margin can be set individually

CSS properties for dimensions

```
p { width: 400px; background-color: yellow; }  
h2 { width: 50%; background-color: aqua; }
```

CSS

This paragraph uses the first style above.

This heading uses the second style above.

-
- width, height: how wide or tall to make this element
 - max-width, max-height, min-width, min-height: the maximum or minimum size of this element in the given dimension
 - all of these apply only to block elements; ignored for inline elements

Centering a block element: `auto` margins

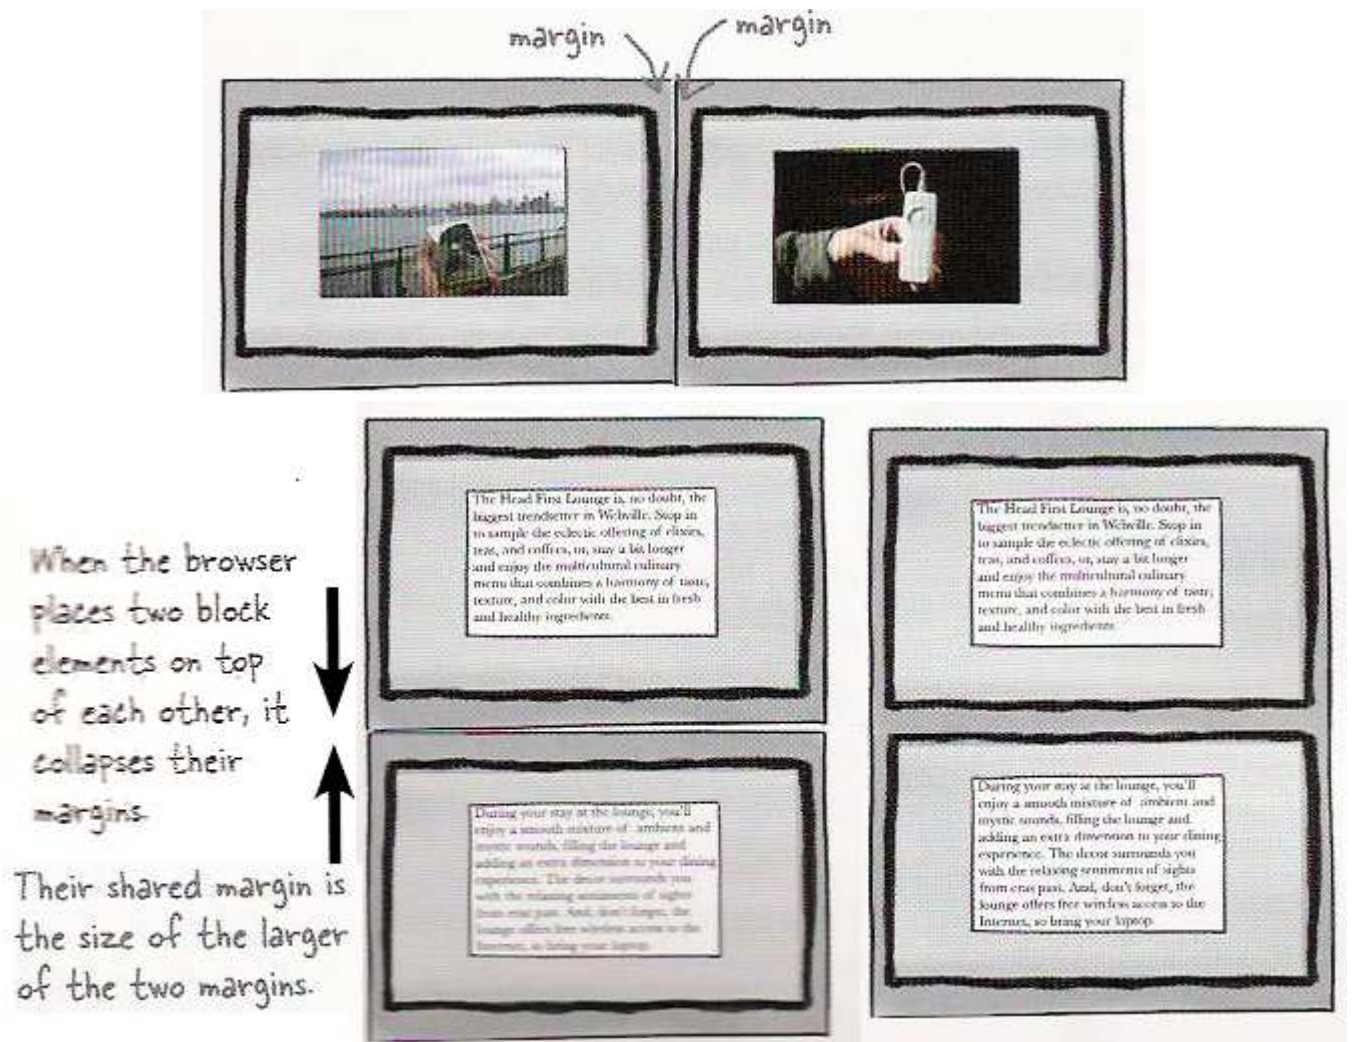

```
p {  
  margin-left: auto; margin-right: auto;  
  width: 750px;  
}
```

CSS

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua.

- only works if `width` is set
(otherwise, element occupies entire width of page)
- to center inline elements within a block element,
use `text-align: center;` instead

Top/bottom margin collapse

- when two block elements appear on top of each other, their margins are collapsed
- their shared margin is the larger of the two individual margins

Floating elements

The CSS `float` and `clear` properties

The CSS `float` property (reference)

```
img.headericon { float: right; width: 130px; }
```

CSS

Borat Sagdiyev (born July 30, 1972) is a fictional Kazakhstani journalist played by British-Jewish comedian Sacha Baron Cohen. He is the main character portrayed in the controversial and successful film *Borat: Cultural Learnings of America for Make Benefit Glorious Nation of Kazakhstan*. Borat ...

-
- `float` can be `left`, `right`, or `none` (default)
 - floating elements are removed from normal document flow
 - underlying text wraps around floating element as necessary

Floating elements diagram

Common float bug: missing width

I am not floating, no width

I am floating right, no width

I am not floating, 45% width

I am floating right, 45% width

- often floating block elements must have a width property value
 - if no width is specified, the floating element may occupy 100% of the page width, so no content can wrap around it

The clear property

```
p { background-color: fuchsia; }  
h2 { clear: right; background-color: yellow; }
```

CSS

Homestar Runner is a Flash animated Internet cartoon. It mixes surreal humour with references to 1980s and 1990s pop culture, notably video games, classic television and popular music.

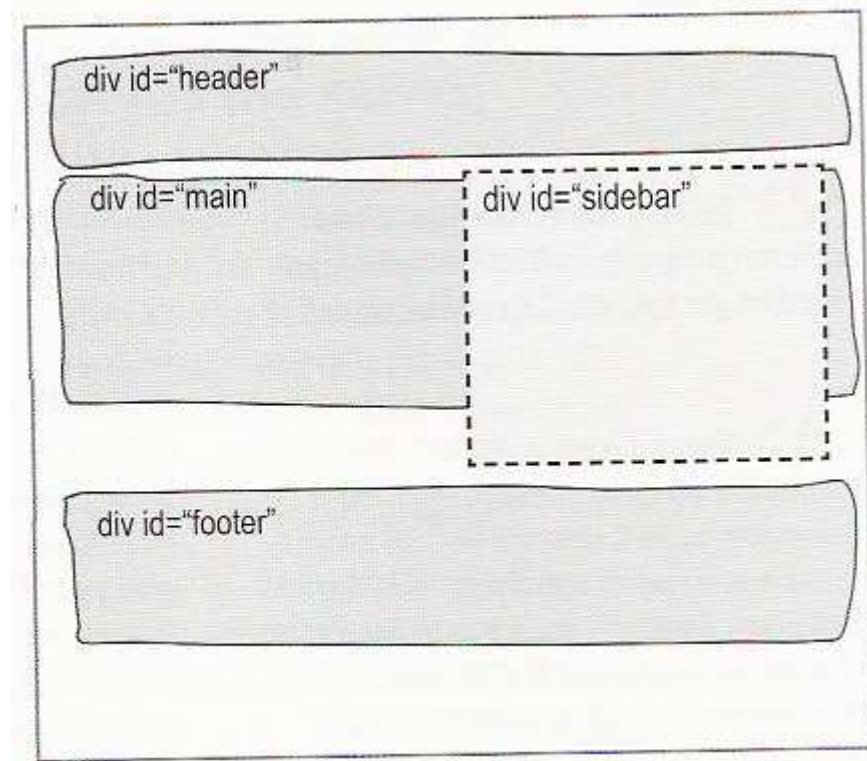

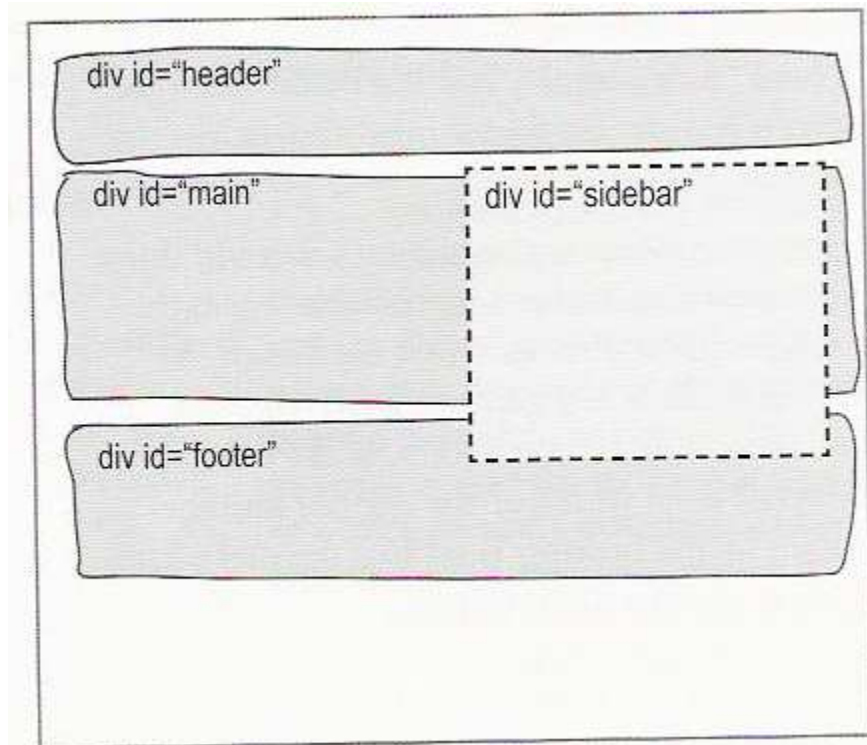

My Homestar Runner Fan Site

- disallows any floating elements from overlapping this element
- clear can be left, right, both, or none (default)

Clear diagram

```
div#sidebar { float: right; }  
div#footer { clear: right; }
```

CSS

Recall: Firefox Firebug extension

"Never increase, beyond what is necessary, the number of entities required to explain anything." William of Ockham (1285-1349)
