

CSE 311 Foundations of Computing I

Lecture 10
Set Theory
Autumn 2012

Announcements

- Reading assignments
 - Wednesday:
 - 4.1-4.2 7th Edition
 - 3.4, 3.6 up to p. 227 6th Edition
 - 2.4, 2.5 up to p. 177 5th Edition
- Homework 4
 - Coming soon . . .

Set Theory

- Formal treatment dates from late 19th century
- Direct ties between set theory and logic
- Important foundational language

Definition: A set is an unordered collection of objects

$x \in A$: “ x is an element of A ”
“ x is a member of A ”
“ x is in A ”
 $x \notin A$: $\neg(x \in A)$

Definitions

- A and B are *equal* if they have the same elements

$$A = B \equiv \forall x (x \in A \leftrightarrow x \in B)$$

- A is a *subset* of B if every element of A is also in B

$$A \subseteq B \equiv \forall x (x \in A \rightarrow x \in B)$$

Empty Set and Power Set

- Empty set \emptyset does not contain any elements
- Power set of a set A = set of all subsets of A

$$\mathcal{P}(A) = \{ B : B \subseteq A \}$$

Cartesian Product : $A \times B$

$$A \times B = \{ (a, b) \mid a \in A \wedge b \in B \}$$

Set operations

$$A \cup B = \{ x \mid (x \in A) \vee (x \in B) \}$$
 union

$$A \cap B = \{ x \mid (x \in A) \wedge (x \in B) \}$$
 intersection

$$A - B = \{ x \mid (x \in A) \wedge (x \notin B) \}$$
 set difference

$$A \oplus B = \{ x \mid (x \in A) \oplus (x \in B) \}$$
 symmetric difference

$$\overline{A} = \{ x \mid x \notin A \}$$
 complement
(with respect to universe U)

It's Boolean algebra again

- Definition for \cup based on \vee
- Definition for \cap based on \wedge
- Complement works like \neg

De Morgan's Laws

$$\overline{A \cup B} = \overline{A} \cap \overline{B}$$

$$\overline{A \cap B} = \overline{A} \cup \overline{B}$$

Proof technique:
To show $C = D$ show
 $x \in C \rightarrow x \in D$ and
 $x \in D \rightarrow x \in C$

Distributive Laws

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

Characteristic vectors: Representing sets using bits

- Suppose universe U is $\{1, 2, \dots, n\}$
- Can represent set $B \subseteq U$ as a vector of bits:

$$b_1 b_2 \dots b_n \text{ where } b_i = 1 \equiv (i \in B)$$

$$b_i = 0 \equiv (i \notin B)$$

– Called the *characteristic vector* of set B

- Given characteristic vectors for A and B
- What is characteristic vector for $A \cup B$? $A \cap B$?

Boolean operations on bit-vectors: (a.k.a. bit-wise operations)

- $$\begin{array}{r} 01101101 \\ \vee 00110111 \\ \hline 01111111 \end{array}$$
 Java: $z = x | y$
- $$\begin{array}{r} 00101010 \\ \wedge 00001111 \\ \hline 00001010 \end{array}$$
 Java: $z = x \& y$
- $$\begin{array}{r} 01101101 \\ \oplus 00110111 \\ \hline 01011010 \end{array}$$
 Java: $z = x \wedge y$

13

A simple identity

- If x and y are bits: $(x \oplus y) \oplus y = ?$
- What if x and y are bit-vectors?

CSE 311

14

Private Key Cryptography

- Alice wants to be able to communicate message secretly to Bob so that eavesdropper Eve who hears their conversation, cannot tell what Alice's message is.
- Alice and Bob can get together and privately share a secret key K ahead of time.

Autumn 2012

CSE 311

15

One-time pad

- Alice and Bob privately share random n -bit vector K
 - Eve does not know K
- Later, Alice has n -bit message m to send to Bob
 - Alice computes $C = m \oplus K$
 - Alice sends C to Bob
 - Bob computes $m = C \oplus K$ which is $(m \oplus K) \oplus K$
- Eve cannot figure out m from C unless she can guess K

16

Unix/Linux file permissions

- `ls -l`
`drwxr-xr-x ... Documents/`
`-rw-r--r-- ... file1`
- Permissions maintained as bit vectors
 - Letter means bit is 1 – means bit is 0.

17

Russell's Paradox

$$S = \{ x \mid x \notin x \}$$

Functions review

- A *function* from A to B
 - an assignment of exactly one element of B to each element of A .
 - We write $f: A \rightarrow B$.
 - "Image of a " = $f(a)$
- *Domain* of $f: A$
- *Range* of f = set of all images of elements of A

Image, Preimage

Is this a function? one-to-one? onto?
