QuickCheck: Number Theory Solutions (due Thursday, October 23)

0. Extended Euclidian Algorithm

Find the multiplicative inverse y of 7 mod 33. That is, find y such that $7y \equiv 1 \pmod{33}$. You should use the extended Euclidean Algorithm. Your answer should be in the range $0 \le y < 29$.

Solution: First, we find the gcd:

$$gcd(33,7) = gcd(7,5)$$
 $33 = |7| \bullet 4 + 5$ (1)

$$= \gcd(5,2) \qquad \qquad 7 = \boxed{5} \bullet 1 + 2 \qquad (2)$$

$$= \gcd(2,1)$$
 $5 = 2 \cdot 2 + 1$ (3)

$$= \gcd(1,0)$$
 $2 = 1 \bullet 2 + 0$ (4)

=1 (5)

Next, we re-arrange equations (1) - (3) by solving for the remainder:

$$1 = 5 - \boxed{2} \bullet 2 \tag{6}$$

$$2 = 7 - \boxed{5} \bullet 1 \tag{7}$$

$$5 = 33 - \boxed{7} \bullet 4 \tag{8}$$

(9)

Now, we backward substitute into the boxed numbers using the equations:

$$1 = 5 - 2 \cdot 2$$

= 5 - (7 - 5 \cdot 1) \cdot 2
= 3 \cdot 5 - 7 \cdot 2
= 3 \cdot (33 - 7 \cdot 4) - 7 \cdot 2
= 33 \cdot 3 + 7 \cdot - 14

So, $1 = 33 \bullet 3 + 7 \bullet -14$. Thus, 33 - 14 = 19 is the multiplicative inverse of 7 mod 33.
