Foundations of Computing I

Fall 2014

1

More Gates!

NAND
 $\neg(X \wedge Y)$

X	Y	Z
0	0	1
0	1	1
1	0	1
1	1	0

NOR
 $\neg(X \vee Y)$

X	Y	Z
0	0	1
0	1	0
1	0	0
1	1	0

XOR
 $X \oplus Y$

X	Y	Z
0	0	0
0	1	1
1	0	1
1	1	0

XNOR
 $X \leftrightarrow Y, X = Y$

X	Y	Z
0	0	1
0	1	0
1	0	0
1	1	1

Slide 2

1 can we omit this slide? we mentioned it on the hw and this feels like info overload?
Adam Blank, 9/27/2014

Review: Logical Equivalence

Terminology: A compound proposition is a...

- **Tautology** if it is always true
- **Contradiction** if it is always false
- **Contingency** if it can be either true or false

$p \vee \neg p$ Tautology!

$p \oplus p$ Contradiction!

$(p \rightarrow q) \wedge p$ Contingency (note: in morning lecture the and was an or!)

$(p \wedge q) \vee (p \wedge \neg q) \vee (\neg p \wedge q) \vee (\neg p \wedge \neg q)$ Tautology!

Review: Logical Equivalence

A and **B** are *logically equivalent* if and only if

$A \leftrightarrow B$ is a tautology

i.e. **A** and **B** have the same truth table

The notation $A \equiv B$ denotes **A** and **B** are logically equivalent

Example: $p \equiv \neg\neg p$

p	$\neg p$	$\neg\neg p$	$p \leftrightarrow \neg\neg p$
T	F	T	T
F	T	F	T

Review: De Morgan's laws

$$\neg (p \wedge q) \equiv \neg p \vee \neg q$$

$$\neg (p \vee q) \equiv \neg p \wedge \neg q$$

```
if (!(front != null && value > front.data))
    front = new ListNode(value, front);
else {
    ListNode current = front;
    while (current.next == null && current.next.data < value)
        current = current.next;
    current.next = new ListNode(value, current.next);
}
```

This code inserts *value* into a sorted linked list.

The first if runs when...front is null or value is smaller than the first item.

The while loop stops when...we've reached the end of the list or the next value is bigger.

Review: Law of Implication

$$(p \rightarrow q) \equiv (\neg p \vee q)$$

p	q	$p \rightarrow q$	$\neg p$	$\neg p \vee q$	$(p \rightarrow q) \leftrightarrow (\neg p \vee q)$
T	T	T	F	T	T
T	F	F	F	F	T
F	T	T	T	T	T
F	F	T	T	T	T

CSE 311: Foundations of Computing

Fall 2013

Lecture 3: Logic and Boolean algebra

Computing Equivalence

Describe an algorithm for computing if two logical expressions/circuits are equivalent.

What is the run time of the algorithm?

Compute the entire truth table for both of them!

There are 2^n entries in the column for n variables.

Some Familiar Properties of Arithmetic

- $x + y = y + x$ (Commutativity)
 - $p \vee q \equiv q \vee p$
 - $p \wedge q \equiv q \wedge p$
- $x \cdot (y + z) = x \cdot y + x \cdot z$ (Distributivity)
 - $p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$
 - $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$
- $(x + y) + z = x + (y + z)$ (Associativity)
 - $(p \vee q) \vee r \equiv p \vee (q \vee r)$
 - $(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$

Properties of Logical Connectives

We will always give you this list!

- **Identity**
 - $p \wedge T \equiv p$
 - $p \vee F \equiv p$
- **Domination**
 - $p \vee T \equiv T$
 - $p \wedge F \equiv F$
- **Idempotent**
 - $p \vee p \equiv p$
 - $p \wedge p \equiv p$
- **Commutative**
 - $p \vee q \equiv q \vee p$
 - $p \wedge q \equiv q \wedge p$
- **Associative**
 - $(p \vee q) \vee r \equiv p \vee (q \vee r)$
 - $(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$
- **Distributive**
 - $p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$
 - $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$
- **Absorption**
 - $p \vee (p \wedge q) \equiv p$
 - $p \wedge (p \vee q) \equiv p$
- **Negation**
 - $p \vee \neg p \equiv T$
 - $p \wedge \neg p \equiv F$

Understanding Connectives

- **Reflect basic rules of reasoning and logic**
- **Allow manipulation of logical formulas**
 - Simplification
 - Testing for equivalence
- **Applications**
 - Query optimization
 - Search optimization and caching
 - Artificial Intelligence
 - Program verification

Some Equivalences Related to Implication

$$\begin{aligned} p \rightarrow q &\equiv \neg p \vee q \\ p \rightarrow q &\equiv \neg q \rightarrow \neg p \\ p \leftrightarrow q &\equiv (p \rightarrow q) \wedge (q \rightarrow p) \\ p \leftrightarrow q &\equiv \neg p \leftrightarrow \neg q \end{aligned}$$

Some Equivalences Related to Implication

$$\begin{aligned} p \rightarrow q &\equiv \neg p \vee q \\ p \rightarrow q &\equiv \neg q \rightarrow \neg p \\ p \leftrightarrow q &\equiv (p \rightarrow q) \wedge (q \rightarrow p) \\ p \leftrightarrow q &\equiv \neg p \leftrightarrow \neg q \end{aligned}$$

Logical Proofs

To show P is equivalent to Q

- Apply a series of logical equivalences to sub-expressions to convert P to Q

To show P is a tautology

- Apply a series of logical equivalences to sub-expressions to convert P to T

Prove this is a Tautology

$$(p \wedge q) \rightarrow (p \vee q)$$

Prove this is a Tautology

$$(p \wedge (p \rightarrow q)) \rightarrow q$$

Prove these are not equivalent

$$(p \rightarrow q) \rightarrow r$$

$$p \rightarrow (q \rightarrow r)$$

Boolean Logic

Combinational Logic

- output = F(input)

Sequential Logic

- $\text{output}_t = F(\text{output}_{t-1}, \text{input}_t)$
 - output dependent on history
 - concept of a time step (clock, t)

Boolean Algebra consisting of...

- a set of elements $B = \{0, 1\}$
- binary operations $\{ +, \cdot \}$ (OR, AND)
- and a unary operation $\{ ' \}$ (NOT)

A Combinational Logic Example

Sessions of Class:

We would like to compute the number of lectures or quiz sections remaining *at the start* of a given day of the week.

- **Inputs:** Day of the Week, Lecture/Section flag
- **Output:** Number of sessions left

Examples: Input: (Wednesday, Lecture) Output: **2**

Input: (Monday, Section) Output: **1**

Implementation in Software

```
public int classesLeft (weekday, lecture_flag) {
    switch (day) {
        case SUNDAY:
        case MONDAY:
            return lecture_flag ? 3 : 1;
        case TUESDAY:
        case WEDNESDAY:
            return lecture_flag ? 2 : 1;
        case THURSDAY:
            return lecture_flag ? 1 : 1;
        case FRIDAY:
            return lecture_flag ? 1 : 0;
        case SATURDAY:
            return lecture_flag ? 0 : 0;
    }
}
```

20

Implementation with Combinational Logic

Encoding:

- How many bits for each input/output?
- Binary number for weekday
- One bit for each possible output

Defining Our Inputs!

```
public int classesLeft (weekday, lecture_flag) {
    switch (day) {
        case SUNDAY:
        case MONDAY:
            return lecture_flag ? 3 : 1;
        case TUESDAY:
        case WEDNESDAY:
            return lecture_flag ? 2 : 1;
        case THURSDAY:
            return lecture_flag ? 1 : 1;
        case FRIDAY:
            return lecture_flag ? 1 : 0;
        case SATURDAY:
            return lecture_flag ? 0 : 0;
    }
}
```

Weekday	Number	Binary
Sunday	0	(000) ₂
Monday	1	(001) ₂
Tuesday	2	(010) ₂
Wednesday	3	(011) ₂
Thursday	4	(100) ₂
Friday	5	(101) ₂
Saturday	6	(110) ₂

Converting to a Truth Table!
