

CSE 311: Foundations of Computing

Fall 2014

Lecture 27: Cardinality

AUTHOR UNKNOWN: GATES RECENTLY ANNOUNCED
TO MAKE A LIST OF ALL SEVEN PERSES.
LITTLE DID SHE KNOW THAT FURBER AND WHITWIND
HAD ALREADY DIED AT THE SAME TIME.

Cardinality and Computability

Computers as we know them grew out of a desire to avoid bugs in mathematical reasoning

A brief history of reasoning

Ancient Greece

- Deductive logic
 - Euclid's Elements
- Infinite things are a problem
 - Zeno's paradox

A brief history of reasoning

- 1670's-1800's Calculus & infinite series
 - Suddenly infinite stuff really matters
 - Reasoning about the infinite still a problem
 - Tendency for buggy or hazy proofs
- Mid-late 1800's
 - Formal mathematical logic
 - Boole **Boolean Algebra**
 - Theory of infinite sets and cardinality
 - Cantor
 - "There are more real #'s than rational #'s"

A brief history of reasoning

- **1900**
 - Hilbert's famous speech outlines goal: mechanize all of mathematics
23 problems
 - **1930's**
 - Gödel, Turing show that Hilbert's program is impossible.
 - Gödel's Incompleteness Theorem
 - Undecidability of the Halting Problem
- Both use ideas from Cantor's proof about reals & rationals

Starting with Cantor

- How big is a set?
 - If S is finite, we already defined $|S|$ to be the number of elements in S .
 - What if S is infinite? Are all of these sets the same size?
 - Natural numbers \mathbb{N}
 - Even natural numbers
 - Integers \mathbb{Z}
 - Rational numbers \mathbb{Q}
 - Real numbers \mathbb{R}

Cardinality

Definition: Two sets A and B are the same size (same **cardinality**) iff there is a 1-1 and onto function $f:A \rightarrow B$

Also applies to infinite sets

Cardinality

- The natural numbers and even natural numbers have the same cardinality:

0 1 2 3 4 5 6 7 8 9 10
...
0 2 4 6 8 10 12 14 16 18 20
...

n is matched with $2n$

Countability

Definition: A set is *countable* iff it is the same size as some subset of the natural numbers

Equivalent: A set S is *countable* iff there is an onto function $g: \mathbb{N} \rightarrow S$

Equivalent: A set S is *countable* iff we can write $S = \{s_1, s_2, s_3, \dots\}$

The set of all integers is countable

Is the set of positive rational numbers countable?

- We can't do the same thing we did for the integers
 - Between any two rational numbers there are an infinite number of others

The set of positive rational numbers **is** countable

1/1	1/2	1/3	1/4	1/5	1/6	1/7	1/8	...
2/1	2/2	2/3	2/4	2/5	2/6	2/7	2/8	...
3/1	3/2	3/3	3/4	3/5	3/6	3/7	3/8	...
4/1	4/2	4/3	4/4	4/5	4/6	4/7	4/8	...
5/1	5/2	5/3	5/4	5/5	5/6	5/7	...	
6/1	6/2	6/3	6/4	6/5	6/6	...		
7/1	7/2	7/3	7/4	7/5	...			
...				

The set of positive rational numbers is countable

1/1 1/2 1/3 1/4 1/5 1/6 1/7 1/8 ...
2/1 2/2 2/3 2/4 2/5 2/6 2/7 2/8 ...
3/1 3/2 3/3 3/4 3/5 3/6 3/7 3/8 ...
4/1 4/2 4/3 4/4 4/5 4/6 4/7 4/8 ...
5/1 5/2 5/3 5/4 5/5 5/6 5/7 ...
6/1 6/2 6/3 6/4 6/5 6/6 ...
7/1 7/2 7/3 7/4 7/5 ...
... ..

The set of positive rational numbers is countable

$\mathbb{Q}^+ = \{1/1, 2/1, 1/2, 3/1, 2/2, 1/3, 4/1, 2/3, 3/2, 1/4, 5/1, 4/2, 3/3, 2/4, 1/5, \dots\}$

List elements in order of

- numerator+denominator
 - breaking ties according to denominator
- Only k numbers have total of k+1

Technique is called “dovetailing”

The Positive Rationals are Countable: Another Way

```
public static rational o2o(nat n) {
    Set<Rational> used = new HashSet<Rational>();
    nat i = 0;
    while (answer == null) {
        for (nat numer=1; ; numer++) {
            for (nat denom=1; denom <= numer; denom++) {
                Rational r = new Rational(numer, denom);
                if (!used.contains(r) && used.size() == i) {
                    return new Rational(numer, denom);
                }
                else if (!used.contains(r)) {
                    used.add(r); i++;
                }
            }
        }
    }
}
```

Claim: Σ^* is countable for every finite Σ

The set of all Java programs is countable

Georg Cantor

- Set theory
- Cardinality
- Continuum hypothesis

Georg Cantor

Cantor's revolutionary ideas were not accepted by the mathematical establishment.

Poincaré referred to them as a "grave disease infecting mathematics."

Kronecker fought to keep Cantor's papers out of his journals.

He spent the last 30 years of his life battling depression, living often in "sanatoriums" (psychiatric hospitals)

What about the real numbers?

Q: Is every set is countable?

A: Theorem [Cantor] The set of real numbers (even just between 0 and 1) is NOT countable

Proof is by contradiction using a new method called **diagonalization**

Supposed listing of $\mathbb{R}^{[0,1]}$

		1	2	3	4	5	6	7	8	9	...
r_1	0.	5	0	0	0	0	0	0	0
r_2	0.	3	3	3	3	3	3	3	3
r_3	0.	1	4	2	8	5	7	1	4
r_4	0.	1	4	1	5	9	2	6	5
r_5	0.	1	2	1	2	2	1	2	2
r_6	0.	2	5	0	0	0	0	0	0
r_7	0.	7	1	8	2	8	1	8	2
r_8	0.	6	1	8	0	3	3	9	4
...

Flipped Diagonal

		1	2	3	4	5	6	7	8	9	...
r_1	0.	5 ¹	0	0	0						
r_2	0.	3	3 ⁵	3	3						
r_3	0.	1	4	2 ⁵	8	5	7	1	4
r_4	0.	1	4	1	5 ¹	9	2	6	5
r_5	0.	1	2	1	2	2 ⁵	1	2	2
r_6	0.	2	5	0	0	0	0 ⁵	0	0
r_7	0.	7	1	8	2	8	1	8 ⁵	2
r_8	0.	6	1	8	0	3	3	9	4 ⁵
...

Flipping Rule:
 If digit is 5, make it 1
 If digit is not 5, make it 5

Flipped Diagonal Number **D**

		1	2	3	4	5	6	7	8	9	...
D =	0.	1									
			5								
				5							
					1						
						5					
							5				
								5			
									5		
										5	
											...

D is in $\mathbb{R}^{[0,1]}$

But for all n , we have $\mathbf{D} \neq r_n$ since they differ on n^{th} digit (which is not 9)
 \Rightarrow list was incomplete
 $\Rightarrow \mathbb{R}^{[0,1]}$ is not countable

the set of all functions $f : \mathbb{N} \rightarrow \{0,1,\dots,9\}$ is not countable

non-computable functions

- We have seen that
 - The set of all (Java) programs is countable
 - The set of all functions $f : \mathbb{N} \rightarrow \{0,1,\dots,9\}$ is not countable
- So...
 - There must be some function $f : \mathbb{N} \rightarrow \{0,1,\dots,9\}$ that is not computable by any program!

Back to the Halting Problem

- Suppose that there is a program **H** that computes the answer to the Halting Problem
- We will build a table with a row for each program (just like we did for uncountability of reals)
- If the supposed program **H** exists then the **D** program we constructed as before will exist and so have a row in the table
- We will see that **D** must have entries like the “flipped diagonal”
 - **D** can't possibly be in the table.
 - Only assumption was that **H** exists. That must be false.

Some possible inputs **x**

	<P ₁ >	<P ₂ >	<P ₃ >	<P ₄ >	<P ₅ >	<P ₆ >
P ₁	0	1	1	0	1	1	1 0 0 0 1 ...
P ₂	1	1	0	1	0	1	1 0 1 1 1 ...
P ₃	1	0	1	0	0	0	0 0 0 0 1 ...
P ₄	0	1	1	0	1	0	1 1 0 1 0 ...
P ₅	0	1	1	1	1	1	1 0 0 0 1 ...
P ₆	1	1	0	0	0	1	1 0 1 1 1 ...
P ₇	1	0	1	1	0	0	0 0 0 0 1 ...
P ₈	0	1	1	1	1	0	1 1 0 1 0 ...
P ₉
.
.

(**P,x**) entry is **1** if program **P** halts on input **x** and **0** if it runs forever

Some possible inputs **x**

	<P ₁ >	<P ₂ >	<P ₃ >	<P ₄ >	<P ₅ >	<P ₆ >
P ₁	0	1	1	0	1	1	1 0 0 0 1 ...
P ₂	1	1	0	1	0	1	1 0 1 1 1 ...
P ₃	1	0	1	0	0	0	0 0 0 0 1 ...
P ₄	0	1	1	0	1	0	1 1 0 1 0 ...
P ₅	0	1	1	1	1	1	1 0 0 0 1 ...
P ₆	1	1	0	0	0	1	1 0 1 1 1 ...
P ₇	1	0	1	1	0	0	0 0 0 0 1 ...
P ₈	0	1	1	1	1	0	1 0 1 0 ...
P ₉
.
.

(**P,x**) entry is **1** if program **P** halts on input **x** and **0** if it runs forever

recall: code for **D** assuming subroutine **H** that solves the halting problem

- Function **D(x)**:
 - if **H(x,x)==true** then
 - **while** (true); /* loop forever */
 - else
 - **return**; /* do nothing and halt */
 - endif

Some possible inputs **x** **D** behaves like flipped diagonal

	<P ₁ >	<P ₂ >	<P ₃ >	<P ₄ >	<P ₅ >	<P ₆ >	...					
P ₁	0 ¹	1	1	0	1	1	1	0	0	0	1	...
P ₂	1	1 ⁰	0	1	0	1	1	0	1	1	1	...
P ₃	1	0	1 ⁰	0	0	0	0	0	0	0	1	...
P ₄	0	1	1	0 ¹	1	0	1	1	0	1	0	...
P ₅	0	1	1	1	1 ⁰	1	1	0	0	0	1	...
P ₆	1	1	0	0	0	1 ⁰	1	0	1	1	1	...
P ₇	1	0	1	1	0	0	0 ¹	0	0	0	1	...
P ₈	0	1	1	1	1	0	1	1 ⁰	0	1	0	...
P ₉
.
.

(**P,x**) entry is **1** if program **P** halts on input **x** and **0** if it runs forever

recall: code for **D** assuming subroutine **H** that solves the halting problem

- Function **D(x)**:
 - if **H(x,x)==true** then
 - **while** (true); /* loop forever */
 - else
 - **return**; /* do nothing and halt */
 - endif
- If **D** existed it would have a row different from every row of the table
 - **D** can't be a program so **H** cannot exist!
