If it's raining, then I have my umbrella.

- Implication:

$$
p \rightarrow q
$$

- Converse: $q \rightarrow p$
- Contrapositive:
- Inverse:

$$
\neg q \rightarrow \neg p
$$

$$
\neg p \rightarrow \neg q
$$

How do these relate to each other?
How to see this?

- $p$ iff $q$
- $p$ is equivalent to $q$
- $p$ implies $q$ and $q$ implies $p$

## Terminology: A compound proposition is a...

- Tautology if it is always true
- Contradiction if it is always false
- Contingency if it can be either true or false

## Classify!

$p \vee \neg p$
$p \oplus p$
$(p \rightarrow q) \wedge p$
$(p \wedge q) \vee(p \wedge \neg q) \vee(\neg p \wedge q) \vee(\neg p \wedge \neg q)$

## Terminology: A compound proposition is a...

- Contradiction if it is always false
- Contingency if it can be either true or false

## Classify!

$A$ and $B$ are logically equivalent if and only if
$A \leftrightarrow B$ is a tautology
i.e. $A$ and $B$ have the same truth table

The notation $A \equiv B$ denotes $A$ and $B$ are logically equivalent.

Example: $p \equiv \neg \neg p$

| $\boldsymbol{p}$ | $\neg \boldsymbol{p}$ | $\neg \neg \boldsymbol{p}$ | $\boldsymbol{p} \leftrightarrow \neg \neg \boldsymbol{p}$ |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
|  |  |  |  |

$A \equiv B$ says that two propositions $A$ and $B$ always mean the same thing.
$A \leftrightarrow B$ is a single proposition that may be true or false depending on the truth values of the variables in $A$ and $B$.
but $A \equiv B$ and $(A \leftrightarrow B) \equiv \mathrm{T}$ have the same meaning.

Note: Why write $A \equiv B$ and not $A=B$ ?
[We use $A=B$ to say that $A$ and $B$ are precisely the same proposition (same sequence of symbols)]
