Spring 2015

Lecture 19: Structural induction and regular expressions

- An *alphabet* Σ is any finite set of characters.

e.g. $\Sigma = \{0,1\}$ or $\Sigma = \{A, B, C, \dots X, Y, Z\}$ or

$\Sigma =$

- The set Σ^* of *strings* over the alphabet Σ is defined by
 - **Basis:** $\varepsilon \in \Sigma^*$ (ε is the empty string)
 - **Recursive:** if $w \in \Sigma^*$, $a \in \Sigma$, then $wa \in \Sigma^*$

Σ^* Basis: $a \forall a \in \Sigma$
 Rec: $w \in \Sigma^* \rightarrow wa \in \Sigma^*$

function definitions on recursively defined sets

Length:

$$\text{len}(\varepsilon) = 0;$$

$$\text{len}(wa) = 1 + \text{len}(w); \text{ for } w \in \Sigma^*, a \in \Sigma$$

Reversal:

$$\varepsilon^R = \varepsilon$$

$$(wa)^R = aw^R \text{ for } w \in \Sigma^*, a \in \Sigma$$

Concatenation:

$$x \cdot \varepsilon = x \text{ for } x \in \Sigma^*$$

$$x \cdot wa = (x \cdot w)a \text{ for } x, w \in \Sigma^*, a \in \Sigma$$

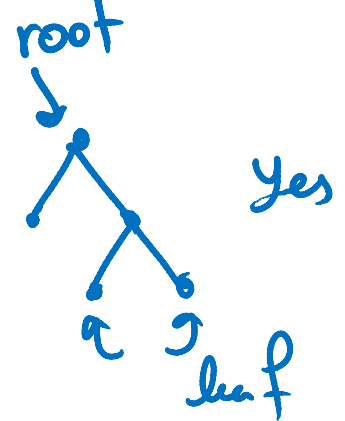

$$x \cdot (a_1 a_2 \dots a_k) = (x \cdot a_1 \dots a_{k-1}) a_k$$

$$= \dots x a_1 a_2 \dots a_k$$

rooted binary trees

- **Basis:**
 - is a rooted binary tree
- **Recursive step:**

If T_1 and T_2 are rooted binary trees,

defining a function on rooted binary trees

Basis

- $\text{size}(\bullet) = 1$

Recursion

- $\text{size} \left(\begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ / \quad \backslash \quad / \quad \backslash \\ \bullet \quad \bullet \quad \bullet \quad \bullet \\ \text{---} \quad \text{---} \quad \text{---} \quad \text{---} \\ T_1 \quad T_2 \end{array} \right) = 1 + \text{size}(T_1) + \text{size}(T_2)$

- $\text{height}(\bullet) = 0$

height = 3

size = 7

- $\text{height} \left(\begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ / \quad \backslash \quad / \quad \backslash \\ \bullet \quad \bullet \quad \bullet \quad \bullet \\ \text{---} \quad \text{---} \quad \text{---} \quad \text{---} \\ T_1 \quad T_2 \end{array} \right) = 1 + \max\{\text{height}(T_1), \text{height}(T_2)\}$

How to prove $\forall x \in S, P(x)$ is true:

Base Case: Show that $P(u)$ is true for all specific elements u of S mentioned in the *Basis step*

Inductive Hypothesis: Assume that P is true for some arbitrary values of *each* of the existing named elements mentioned in the *Recursive step*

Inductive Step: Prove that $P(w)$ holds for each of the new elements w constructed in the *Recursive step* using the named elements mentioned in the Inductive Hypothesis

Conclude that $\forall x \in S, P(x)$

structural induction for strings

Let S be a set of strings over $\Sigma = \{a, b\}$ defined by

Basis: $a \in S$

Recursive:

If $w \in S$ then $wa \in S$ and $wba \in S$

If $u, v \in S$ then $uv \in S$

Claim: If $w \in S$ then w has more a 's than b 's.

$P(w) =$ " w has more a 's than b 's ".

Base Case $P(a)$ holds because a has more a 's than b 's

IH: $P(w), P(u), P(v)$ hold for some $w, u, v \in S$

IS: $\#_a(wa) = 1 + \#_a(w) > 1 + \#_b(w) > \#_b(w) \Rightarrow P(wa)$

$\#_a(wba) = 1 + \#_a(w) > 1 + \#_b(w) = \#_b(wba) \Rightarrow P(wba)$

proof continued?

$$\begin{aligned} \#_a(uv) &= \#_a(u) + \#_a(v) > \#_b(u) + \#_b(v) \\ &\stackrel{\text{IH}}{\text{IH}} P(u) \& P(v) \\ &= \#_b(uv) \end{aligned}$$

$\Rightarrow P(uv)$ holds

Conclusion: $P(w)$ holds for all $w \in S$.

prove: $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ for all $x, y \in \Sigma^*$

Let $P(y)$ be " $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ for all $x \in \Sigma^*$ "

Base Case: $P(\varepsilon)$ holds

$$\text{len}(x \cdot \varepsilon) \underset{\uparrow \text{def.}}{=} \text{len}(x) \underset{\uparrow \text{def of len}}{=} \text{len}(x) + \text{len}(\varepsilon) \quad \checkmark$$

IH: $P(y)$ holds for some $y \in \Sigma^*$

IS: $\forall a \in \Sigma, P(ya)$ holds.

Fix $x \in \Sigma^*$.

$$\text{len}(x \cdot ya) \underset{\uparrow \text{def.}}{=} \text{len}((x \cdot y)a) \underset{\uparrow \text{def len}}{=} \text{len}(x \cdot y) + 1$$

$$\begin{aligned} \text{IH} &\rightarrow = \text{len}(x) + \text{len}(y) + 1 \\ &= \text{len}(x) + \text{len}(ya) \end{aligned}$$

def of $\text{len} \Rightarrow P(ya)$ holds

Length:

$$\text{len}(\varepsilon) = 0;$$

$$\text{len}(wa) = 1 + \text{len}(w); \text{ for } w \in \Sigma^*, a \in \Sigma$$

defining a function on rooted binary trees

- $\text{size}(\bullet) = 1$

- $\text{size} \left(\begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \quad \swarrow \quad \searrow \\ \text{---} \quad \text{---} \quad \text{---} \quad \text{---} \\ T_1 \quad T_2 \end{array} \right) = 1 + \text{size}(T_1) + \text{size}(T_2)$

- $\text{height}(\bullet) = 0$

- $\text{height} \left(\begin{array}{c} \bullet \\ \swarrow \quad \searrow \\ \bullet \quad \bullet \\ \swarrow \quad \searrow \quad \swarrow \quad \searrow \\ \text{---} \quad \text{---} \quad \text{---} \quad \text{---} \\ T_1 \quad T_2 \end{array} \right) = 1 + \max\{\text{height}(T_1), \text{height}(T_2)\}$

size vs. height

Claim: For every rooted binary tree T , $\text{size}(T) \leq 2^{\text{height}(T)+1} - 1$

$$P(T) = \text{size}(T) \leq 2^{\text{height}(T)+1} - 1$$

Base Case: $P(\cdot)$
 $\text{size}(\cdot) = 1 \leq 2^{0+1} - 1 = 2^1 - 1 = 1$

IH: $P(T_1), P(T_2)$ hold for some T_1, T_2 .

IS: $P(\underbrace{T_1 \quad T_2}_2 T_3)$ holds

languages: sets of strings

Sets of strings that satisfy special properties are called **languages**.

Examples:

- English sentences
- Syntactically correct Java/C/C++ programs
- Σ^* = All strings over alphabet Σ
- Palindromes over Σ
- Binary strings that don't have a 0 after a 1
- Legal variable names, keywords in Java/C/C++
- Binary strings with an equal # of 0's and 1's
