

# CSE 311: Foundations of Computing

---

## Lecture 12: Two's Complement, Primes, GCD

# n-bit Unsigned Integer Representation

---

- Represent integer  $x$  as sum of powers of 2:

If  $\sum_{i=0}^{n-1} b_i 2^i$  where each  $b_i \in \{0,1\}$

then representation is  $b_{n-1} \dots b_2 b_1 b_0$

$$99 = 64 + 32 + 2 + 1$$

$$18 = 16 + 2$$

- For  $n = 8$ :

99: 0110 0011

18: 0001 0010

# Sign-Magnitude Integer Representation

---

$n$ -bit signed integers

Suppose that  $-2^{n-1} < x < 2^{n-1}$

First bit as the sign,  $n - 1$  bits for the value

$$99 = 64 + 32 + 2 + 1$$

$$18 = 16 + 2$$

For  $n = 8$ :

99: 0110 0011

-18: 1001 0010

Any problems with this representation?

# Two's Complement Representation

---

$n$  bit signed integers, first bit will still be the sign bit

Suppose that  $0 \leq x < 2^{n-1}$  ,

$x$  is represented by the binary representation of  $x$

Suppose that  $0 < x \leq 2^{n-1}$  ,

$-x$  is represented by the binary representation of  $2^n - x$

**Key property:** Two's complement representation of any number  $y$  is equivalent to  $y \bmod 2^n$  so arithmetic works **mod**  $2^n$

$$99 = 64 + 32 + 2 + 1$$

$$18 = 16 + 2$$

For  $n = 8$ :

99: 0110 0011

-18: 1110 1110

# Sign-Magnitude vs. Two's Complement

---

-7	-6	-5	-4	-3	-2	-1	0	1	2	3	4	5	6	7
1111	1110	1101	1100	1011	1010	1001	0000	0001	0010	0011	0100	0101	0110	0111

Sign-bit

-8	-7	-6	-5	-4	-3	-2	-1	0	1	2	3	4	5	6	7
1000	1001	1010	1011	1100	1101	1110	1111	0000	0001	0010	0011	0100	0101	0110	0111

Two's complement

# Two's Complement Representation

---

- For  $0 < x \leq 2^{n-1}$ ,  $-x$  is represented by the binary representation of  $2^n - x$ 
  - That is, the two's complement representation of any number  $y$  has the same value as  $y$  modulo  $2^n$ .
- To compute this: Flip the bits of  $x$  then add 1:
  - All 1's string is  $2^n - 1$ , so
    - Flip the bits of  $x \equiv$  replace  $x$  by  $2^n - 1 - x$
    - Then add 1 to get  $2^n - x$

# Basic Applications of mod

---

- Hashing
- Pseudo random number generation
- Simple cipher

# Hashing

---

## Scenario:

Map a small number of data values from a large domain  $\{0, 1, \dots, M - 1\}$  ...

...into a small set of locations  $\{0, 1, \dots, n - 1\}$  so one can quickly check if some value is present

- $\text{hash}(x) = x \bmod p$  for  $p$  a prime close to  $n$ 
  - or  $\text{hash}(x) = (ax + b) \bmod p$
- Depends on all of the bits of the data
  - helps avoid collisions due to similar values
  - need to manage them if they occur

# Pseudo-Random Number Generation

---

## Linear Congruential method

$$x_{n+1} = (a x_n + c) \bmod m$$

**Choose random  $x_0, a, c, m$  and produce a long sequence of  $x_n$ 's**

# Simple Ciphers

---

- **Caesar cipher**,  $A = 1$ ,  $B = 2, \dots$ 
  - HELLO WORLD
- **Shift cipher**
  - $f(p) = (p + k) \bmod 26$
  - $f^{-1}(p) = (p - k) \bmod 26$
- **More general**
  - $f(p) = (ap + b) \bmod 26$

# Primality

---

An integer  $p$  greater than 1 is called *prime* if the only positive factors of  $p$  are 1 and  $p$ .

A positive integer that is greater than 1 and is not prime is called *composite*.

# Fundamental Theorem of Arithmetic

---

Every positive integer greater than 1 has a unique prime factorization

$$48 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$$

$$591 = 3 \cdot 197$$

$$45,523 = 45,523$$

$$321,950 = 2 \cdot 5 \cdot 5 \cdot 47 \cdot 137$$

$$1,234,567,890 = 2 \cdot 3 \cdot 3 \cdot 5 \cdot 3,607 \cdot 3,803$$

# Euclid's Theorem

---

**There are an infinite number of primes.**

**Proof by contradiction:**

Suppose that there are only a finite number of primes and call the full list  $p_1, p_2, \dots, p_n$ .

# Euclid's Theorem

---

**There are an infinite number of primes.**

**Proof by contradiction:**

Suppose that there are only a finite number of primes and call the full list  $p_1, p_2, \dots, p_n$ .

Define the number  $P = p_1 \cdot p_2 \cdot p_3 \cdot \dots \cdot p_n$  and let  
 $Q = P + 1$ .

# Euclid's Theorem

---

**There are an infinite number of primes.**

**Proof by contradiction:**

Suppose that there are only a finite number of primes and call the full list  $p_1, p_2, \dots, p_n$ .

Define the number  $P = p_1 \cdot p_2 \cdot p_3 \cdot \dots \cdot p_n$  and let  $Q = P + 1$ .

**Case 1:  $Q$  is prime:** Then  $Q$  is a prime different from all of  $p_1, p_2, \dots, p_n$  since it is bigger than all of them.

**Case 2:  $Q > 1$  is not prime:** Then  $Q$  has some prime factor  $p$  (which must be in the list). Therefore  $p|P$  and  $p|Q$  so  $p|(Q - P)$  which means that  $p|1$ .

Both cases are contradictions so the assumption is false. ■

# Famous Algorithmic Problems

---

- **Primality Testing**
  - Given an integer  $n$ , determine if  $n$  is prime
- **Factoring**
  - Given an integer  $n$ , determine the prime factorization of  $n$

# Factoring

---

**Factor the following 232 digit number [RSA768]:**

123018668453011775513049495838496272077

# Greatest Common Divisor

---

**GCD(a, b):**

**Largest integer  $d$  such that  $d \mid a$  and  $d \mid b$**

- $\text{GCD}(100, 125) =$
- $\text{GCD}(17, 49) =$
- $\text{GCD}(11, 66) =$
- $\text{GCD}(13, 0) =$
- $\text{GCD}(180, 252) =$

# GCD and Factoring

---

$$a = 2^3 \cdot 3 \cdot 5^2 \cdot 7 \cdot 11 = 46,200$$

$$b = 2 \cdot 3^2 \cdot 5^3 \cdot 7 \cdot 13 = 204,750$$

$$\text{GCD}(a, b) = 2^{\min(3,1)} \cdot 3^{\min(1,2)} \cdot 5^{\min(2,3)} \cdot 7^{\min(1,1)} \cdot 11^{\min(1,0)} \cdot 13^{\min(0,1)}$$

**Factoring is expensive!**

**Can we compute  $\text{GCD}(a,b)$  without factoring?**

## Useful GCD Fact

---

If  $a$  and  $b$  are positive integers, then  
$$\gcd(a, b) = \gcd(b, a \bmod b)$$

# Useful GCD Fact

---

If  $a$  and  $b$  are positive integers, then  
$$\gcd(a, b) = \gcd(b, a \bmod b)$$

**Proof:**

By definition of mod,  $a = qb + (a \bmod b)$  for some integer  $q = a \operatorname{div} b$ .

Let  $d = \gcd(a, b)$ . Then  $d|a$  and  $d|b$  so  $a = kd$  and  $b = jd$   
for some integers  $k$  and  $j$ .

Therefore  $(a \bmod b) = a - qb = kd - qjd = (k - qj)d$ .

So,  $d|(a \bmod b)$  and since  $d|b$  we must have  $d \leq \gcd(b, a \bmod b)$ .

Now, let  $e = \gcd(b, a \bmod b)$ . Then  $e|b$  and  $e|(a \bmod b)$  so  
 $b = me$  and  $(a \bmod b) = ne$  for some integers  $m$  and  $n$ .

Therefore  $a = qb + (a \bmod b) = qme + ne = (qm + n)e$ .

So,  $e|a$  and since  $e|b$  we must have  $e \leq \gcd(a, b)$ .

It follows that  $\gcd(a, b) = \gcd(b, a \bmod b)$ . ■

## Another simple GCD fact

---

If  $a$  is a positive integer,  $\gcd(a, 0) = a$ .

# Euclid's Algorithm

---

$$\text{gcd}(a, b) = \text{gcd}(b, a \bmod b), \text{gcd}(a, 0) = a$$

```
int gcd(int a, int b){ /* a >= b, b >= 0 */
    if (b == 0) {
        return a;
    }
    else {
        return gcd(b, a % b);
    }
}
```

Example: GCD(660, 126)

# Euclid's Algorithm

---

Repeatedly use  $\gcd(a, b) = \gcd(b, a \bmod b)$  to reduce numbers until you get  $\gcd(g, 0) = g$ .

$\gcd(660, 126) =$

# Euclid's Algorithm

---

Repeatedly use  $\gcd(a, b) = \gcd(b, a \bmod b)$  to reduce numbers until you get  $\gcd(g, 0) = g$ .

$$\begin{aligned}\gcd(660, 126) &= \gcd(126, 660 \bmod 126) = \gcd(126, 30) \\ &= \gcd(30, 126 \bmod 30) = \gcd(30, 6) \\ &= \gcd(6, 30 \bmod 6) = \gcd(6, 0) \\ &= 6\end{aligned}$$

# Bézout's theorem

---

If  $a$  and  $b$  are positive integers, then there exist integers  $s$  and  $t$  such that

$$\gcd(a,b) = sa + tb.$$

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

**Step 1 (Compute GCD & Keep Intermediary Information):**

$a$	$b$	$b$	$a \bmod b = r$	$b$	$r$	$a = q * b + r$
$\gcd(35, 27)$	$= \gcd(27, 35 \bmod 27)$	$= \gcd(27, 8)$	$(35 = 1 * 27 + 8)$			
$= \gcd(8, 27 \bmod 8)$	$= \gcd(8, 3)$	$(27 = 3 * 8 + 3)$				
$= \gcd(3, 8 \bmod 3)$	$= \gcd(3, 2)$	$(8 = 2 * 3 + 2)$				
$= \gcd(2, 3 \bmod 2)$	$= \gcd(2, 1)$	$(3 = 1 * 2 + 1)$				
$= \gcd(1, 2 \bmod 1)$	$= \gcd(1, 0)$					

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

**Step 2 (Solve the equations for r):**

$$a = q * b + r$$

$$35 = 1 * 27 + 8$$

$$27 = 3 * 8 + 3$$

$$8 = 2 * 3 + 2$$

$$3 = 1 * 2 + 1$$

$$2 = 2 * 1 + 0$$

$$r = a - q * b$$

$$8 = 35 - 1 * 27$$

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

**Step 2 (Solve the equations for r):**

$$a = q * b + r$$

$$35 = 1 * 27 + 8$$

$$27 = 3 * 8 + 3$$

$$8 = 2 * 3 + 2$$

$$3 = 1 * 2 + 1$$

$$2 = 2 * 1 + 0$$

$$r = a - q * b$$

$$8 = 35 - 1 * 27$$

$$3 = 27 - 3 * 8$$

$$2 = 8 - 2 * 3$$

$$1 = 3 - 1 * 2$$

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

## Step 3 (Backward Substitute Equations):

$$8 = 35 - 1 * \textcircled{27}$$

$$3 = 27 - 3 * \textcircled{8}$$

$$2 = 8 - 2 * \textcircled{3}$$

$$1 = 3 - 1 * \textcircled{2}$$

$$\begin{aligned} 1 &= 3 - 1 * (8 - 2 * 3) \\ &= 3 - 8 + 2 * 3 \\ &= (-1) * 8 + 3 * 3 \end{aligned}$$

Plug in the def of 2

Re-arrange into  
3's and 8's

# Extended Euclidean algorithm

---

- Can use Euclid's Algorithm to find  $s, t$  such that

$$\gcd(a, b) = sa + tb$$

## Step 3 (Backward Substitute Equations):

Plug in the def of 2

$$8 = 35 - 1 * \textcircled{27}$$

$$3 = 27 - 3 * \textcircled{8}$$

$$2 = 8 - 2 * \textcircled{3}$$

$$1 = 3 - 1 * \textcircled{2}$$

Re-arrange into  
27's and 35's

$$1 = 3 - 1 * (8 - 2 * 3)$$

$$= 3 - 8 + 2 * 3$$

Re-arrange into  
3's and 8's

$$= (-1) * 8 + 3 * 3$$

Plug in the def of 3

$$= (-1) * 8 + 3 * (27 - 3 * 8)$$

$$= (-1) * 8 + 3 * 27 + (-9) * 8$$

$$= 3 * 27 + (-10) * 8$$

Re-arrange into  
8's and 27's

$$= 3 * 27 + (-10) * (35 - 1 * 27)$$

$$= 3 * 27 + (-10) * 35 + 10 * 27$$

$$= 13 * 27 + (-10) * 35$$

## **multiplicative inverse mod $m$**

---

**Suppose  $\text{GCD}(a, m) = 1$**

**By Bézout's Theorem, there exist integers  $s$  and  $t$  such that  $sa + tm = 1$ .**

**$s \bmod m$  is the multiplicative inverse of  $a$ :**

$$1 = (sa + tm) \bmod m = sa \bmod m$$

## Example

---

**Solve:**  $7x \equiv 1 \pmod{26}$

# Example

---

**Solve:  $7x \equiv 1 \pmod{26}$**

$$\gcd(26, 7) = \gcd(7, 5) = \gcd(5, 2) = \gcd(2, 1) = 1$$

$$\begin{array}{ll} 26 = 7 * 3 + 5 & 5 = 26 - 7 * 3 \\ 7 = 5 * 1 + 2 & 2 = 7 - 5 * 1 \\ 5 = 2 * 2 + 1 & 1 = 5 - 2 * 2 \end{array}$$

$$\begin{aligned} 1 &= 5 - 2 * (7 - 5 * 1) \\ &= (-7) * 2 + 3 * 5 \\ &= (-7) * 2 + 3 * (26 - 7 * 3) \\ &= (-11) * 7 + 3 * 26 \end{aligned}$$

Multiplicative inverse of 7 mod 26

Now  $(-11) \bmod 26 = 15$ . So,  $x = 15 + 26k$  for  $k \in \mathbb{Z}$ .

## Example of a more general equation

---

Now solve:  $7y \equiv 3 \pmod{26}$

We already computed that **15** is the multiplicative inverse of **7** modulo **26**:

That is,  $7 \cdot 15 \equiv 1 \pmod{26}$

By the multiplicative property of mod we have

$$7 \cdot 15 \cdot 3 \equiv 3 \pmod{26}$$

So any  $y \equiv 15 \cdot 3 \pmod{26}$  is a solution.

That is,  $y = 19 + 26k$  for any integer  $k$  is a solution.

# Math mod a prime is especially nice

---

$\gcd(a, m) = 1$  if  $m$  is prime and  $0 < a < m$  so  
can always solve these equations mod a prime.

+	0	1	2	3	4	5	6
