Lecture 23: Finite State Machine Minimization & NFAs

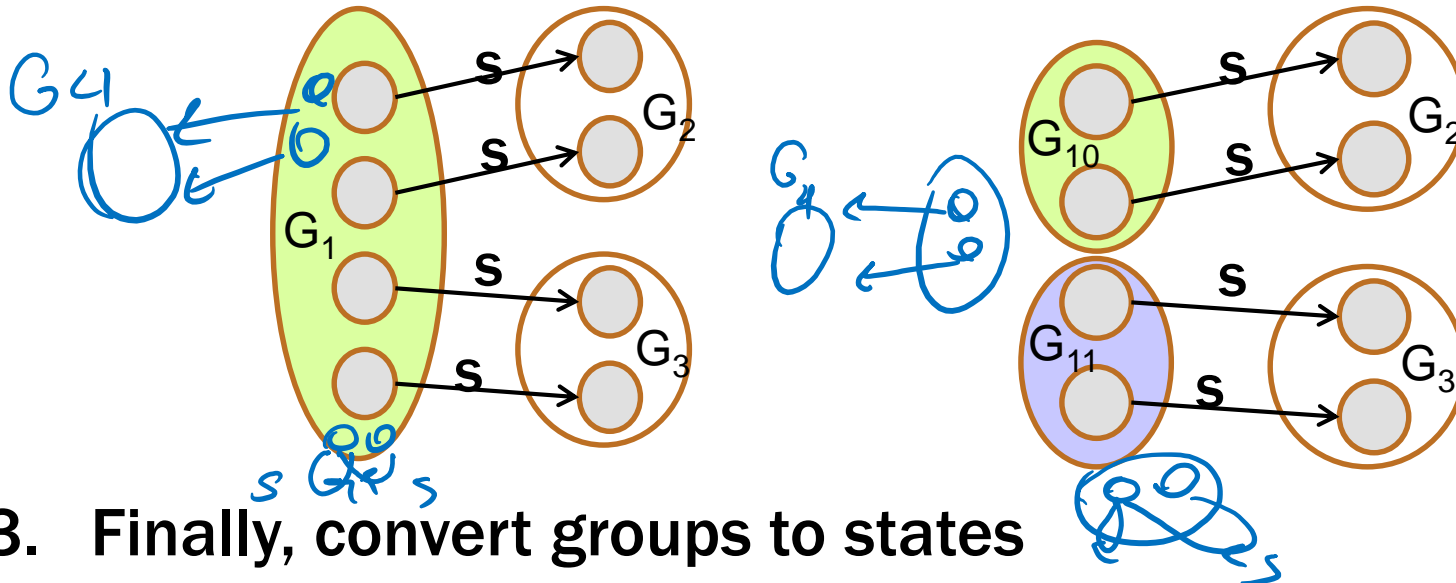

"I THINK YOU SHOULD BE MORE EXPLICIT HERE IN STEP TWO."

State Minimization

- **Many different FSMs (DFAs) for the same problem**
- **Take a given FSM and try to reduce its state set by combining states**
 - **Algorithm will always produce the unique minimal equivalent machine (up to renaming of states) but we won't prove this**

State Minimization Algorithm

1. Put states into groups based on their outputs (or whether they are final states or not)
2. Repeat the following until no change happens
 - a. If there is a symbol **s** so that not all states in a group **G** agree on which group **s** leads to, split **G** into smaller groups based on which group the states go to on **s**

3. Finally, convert groups to states

State Minimization Example

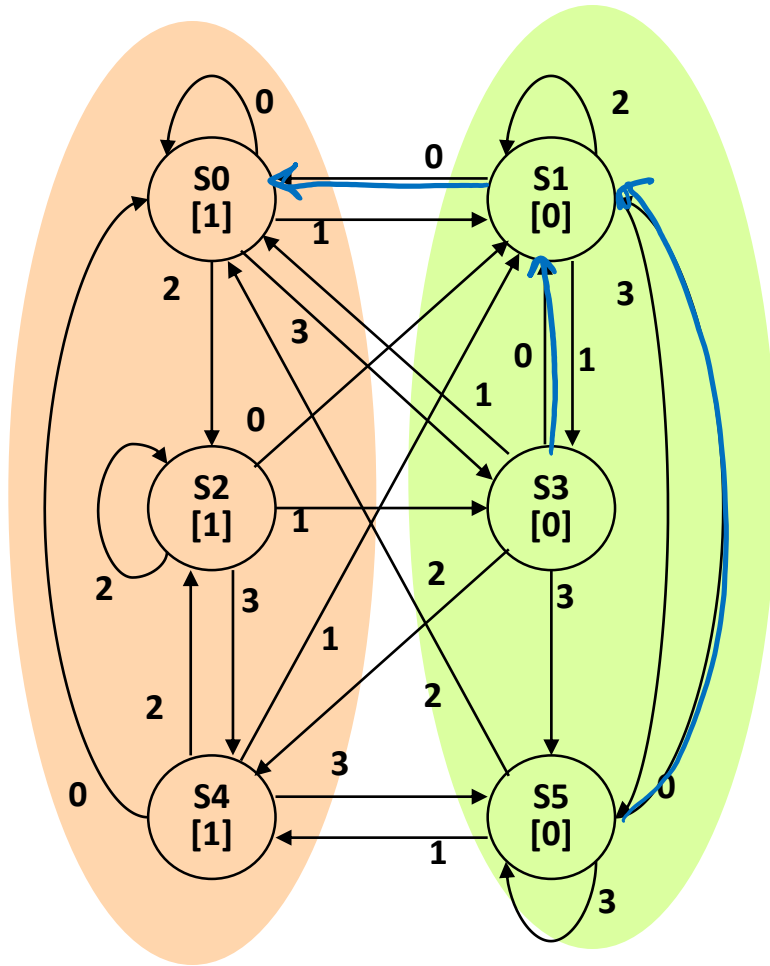

present state	next state				output
	0	1	2	3	
S0	S0	S1	S2	S3	1
S1	S0	S3	S1	S5	0
S2	S1	S3	S2	S4	1
S3	S1	S0	S4	S5	0
S4	S0	S1	S2	S5	1
S5	S1	S4	S0	S5	0

state transition table

A Simpler Minimization Example

A Simpler Minimization Example

**Split states into
final/non-final groups**

**Every symbol causes
the DFA to go from one
group to the other so
neither group needs to
be split**

Minimized DFA

Another way to look at DFAs

Definition: The label of a path in a DFA is the concatenation of all the labels on its edges in order

Lemma: x is in the language recognized by a DFA iff x labels a path from the start state to some final state

Nondeterministic Finite Automata (NFA)

- Graph with start state, final states, edges labeled by symbols (like DFA) but

- Not required to have exactly 1 edge out of each state labeled by each symbol— can have 0 or >1

- Also can have edges labeled by empty string ϵ

- **Definition:** x is in the language recognized by an NFA if and only if x labels a path from the start state to some final state

Consider This NFA

What language does this NFA accept?

$$(10(10)^*) \cup (111(011)^*)$$

Consider This NFA
