Lecture 22: DFA Minimization!

State Minimization

- Many different FSMs (DFAs) for the same problem

Before we
begin....

State Minimization

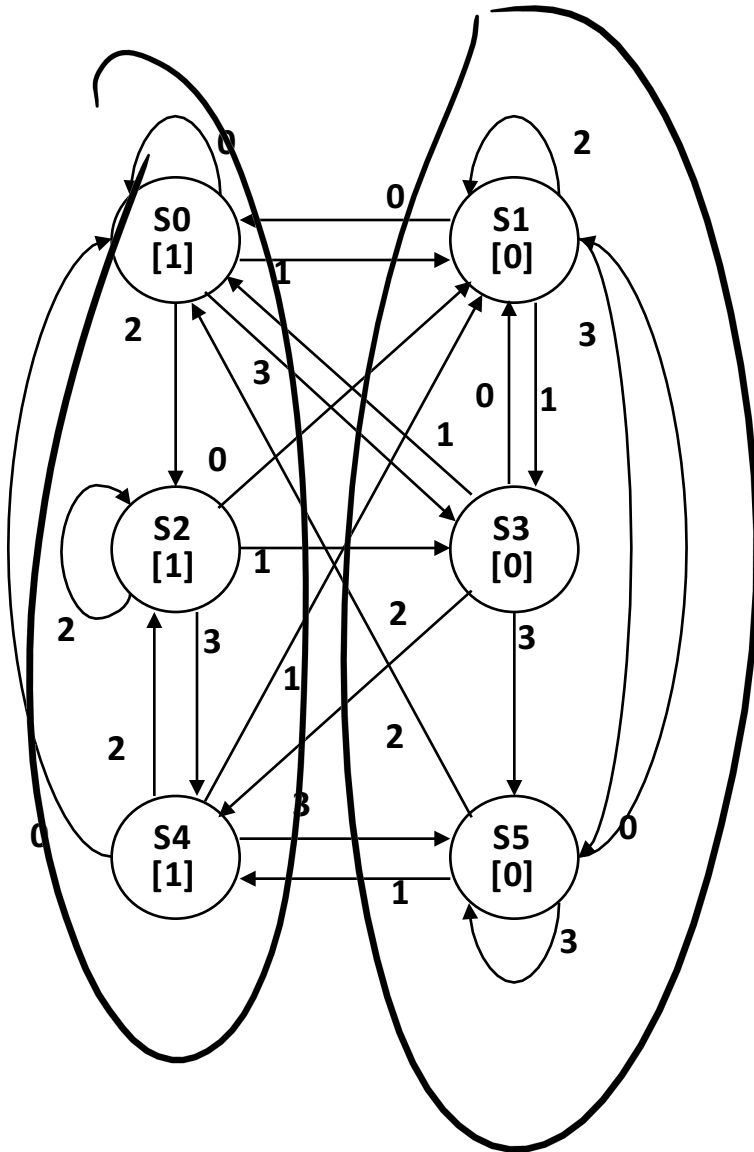

- **Many different FSMs (DFAs) for the same problem**
- **Take a given FSM and try to reduce its state set by combining states**
 - **Algorithm will always produce the unique minimal equivalent machine (up to renaming of states) but we won't prove this**

State Minimization Algorithm

1. Put states into groups based on their outputs (or whether they are final states or not)
2. Repeat the following until no change happens
 - a. If there is a symbol s so that not all states in a group G agree on which group s leads to, split G into smaller groups based on which group the states go to on s

State Minimization Example

present state	next state				output
	0	1	2	3	
S0	S0	S1	S2	S3	1
S1	S0	S3	S1	S5	0
S2	S1	S3	S2	S4	1
S3	S1	S0	S4	S5	0
S4	S0	S1	S2	S5	1
S5	S1	S4	S0	S5	0

Another way to look at DFAs

Definition: The label of a path in a DFA is the concatenation of all the labels on its edges in order

Lemma: x is in the language recognized by a DFA iff x labels a path from the start state to some final state

Nondeterministic Finite Automata (NFA)

- Graph with start state, final states, edges labeled by symbols (like DFA) but
 - Not required to have exactly 1 edge out of each state labeled by each symbol— can have 0 or >1
 - Also can have edges labeled by empty string ϵ
- **Definition:** x is in the language recognized by an NFA if and only if x labels a path from the start state to some final state
