Section 09: Solutions

1. CFGs

   (a) All binary strings that end in 00.
   Solution:
   \[ S \rightarrow 0S \mid 1S \mid 00 \]

   (b) All binary strings that contain at least three 1's.
   Solution:
   \[ S \rightarrow TTT \\
   T \rightarrow 0T \mid T0 \mid 1T \mid 1 \]

   (c) All binary strings with an equal number of 1's and 0's.
   Solution:
   \[ S \rightarrow 0S1S \mid 1S0S \mid \varepsilon \]
   and
   \[ S \rightarrow SS \mid 0S1 \mid 1S0 \mid \varepsilon \]
   both work. Note: The fact that all the strings generated have the property is easy to show (by induction) but the fact that one can generate all strings with the property is trickier. To argue this that each of these is grammars is enough one would need to consider how the difference between the # of 0's seen and the # of 1's seen occurs in prefixes of any string with the property.

2. Relations

   (a) Draw the transitive-reflexive closure of \{(1, 2), (2, 3), (3, 4)\}.
   Solution:
(b) Suppose that $R$ is reflexive. Prove that $R \subseteq R^2$.

**Solution:**

Suppose $(a, b) \in R$. Since $R$ is reflexive, we know $(b, b) \in R$ as well. Since there is a $b$ such that $(a, b) \in R$ and $(b, b) \in R$, it follows that $(a, b) \in R^2$. Thus, $R \subseteq R^2$.

(c) Consider the relation $R = \{(x, y) : x = y + 1\}$ on $\mathbb{N}$. Is $R$ reflexive? Transitive? Symmetric? Anti-symmetric?

**Solution:**

It isn’t reflexive, because $1 \neq 1 + 1$; so, $(1, 1) \notin R$. It isn’t symmetric, because $(2, 1) \in R$ (because $2 = 1 + 1$), but $(1, 2) \notin R$, because $1 \neq 2 + 1$. It isn’t transitive, because note that $(3, 2) \in R$ and $(2, 1) \in R$, but $(3, 1) \notin R$. It is anti-symmetric, because consider $(x, y) \in R$ such that $x \neq y$. Then, $x = y + 1$ by definition of $R$. However, $(y, x) \notin R$, because $y = x - 1 \neq x + 1$.

(d) Consider the relation $S = \{(x, y) : x^2 = y^2\}$ on $\mathbb{R}$. Prove that $S$ is reflexive, transitive, and symmetric.

**Solution:**

Consider $x \in \mathbb{R}$. Note that by definition of equality, $x^2 = x^2$; so, $(x, x) \in S$; so, $S$ is reflexive.

Consider $(x, y) \in S$. Then, $x^2 = y^2$. It follows that $y^2 = x^2$; so, $(y, x) \in S$. So, $S$ is symmetric.

Suppose $(x, y) \in S$ and $(y, z) \in S$. Then, $x^2 = y^2$, and $y^2 = z^2$. Since equality is transitive, $x^2 = z^2$. So, $(x, z) \in S$. So, $S$ is transitive.

3. **DFAs, Stage 1**

Construct DFAs to recognize each of the following languages. Let $\Sigma = \{0, 1, 2, 3\}$.

(a) All binary strings.

**Solution:**
(b) All strings whose digits sum to an even number.
Solution:

4. DFAs, Stage 2

Construct DFAs to recognize each of the following languages. Let $\Sigma = \{0, 1\}$.

(a) All strings which do not contain the substring 101.
Solution:

(b) All strings containing at least two 0’s and at most one 1.
Solution:
(c) All strings containing an even number of 1's and an odd number of 0's and not containing the substring 10.

Solution:

5. NFAs

(a) What language does the following NFA accept?

Solution:

All strings of only 0's and 1's not containing more than one 1.

(b) Create an NFA for the language “all binary strings that have a 1 as one of the last three digits”.

Solution:
6. DFAs & Minimization

Note: We will not test you on minimization, although you may optionally read the extra slides and do this problem for fun

(a) Convert the NFA from 1a to a DFA, then minimize it.

Solution:

[begins diagram]

(b) Minimize the following DFA:

Solution:

Step 1: $q_0, q_2$ are final states and the rest are not final. So, we start with the initial partition with the following groups: group 1 is $\{q_0, q_2\}$ and group 2 is $\{q_1, q_3, q_4\}$.

Step 2: $q_1$ is sending $a$ to group 1 while $q_3, q_4$ are sending $a$ to group 2. So, we divide group 2. We get the following groups: group 1 is $\{q_0, q_2\}$, group 3 is $\{q_1\}$ and group 4 is $\{q_3, q_4\}$.

Step 3: $q_0$ is sending $a$ to group 3 and $q_2$ is sending $a$ to group 4. So, we divide group 1. We will have the following groups: group 3 is $\{q_1\}$, group 4 is $\{q_3, q_4\}$, group 5 is $\{q_0\}$ and group 6 is $\{q_2\}$.
The minimized DFA is the following:
