

## Regular Expressions

### Basis:

$\varepsilon$  is a regular expression. The empty string itself matches the pattern (and nothing else does).

$\emptyset$  is a regular expression. No strings match this pattern.

$a$  is a regular expression, for any  $a \in \Sigma$  (i.e. any character). The character itself matching this pattern.

### Recursive

If  $A, B$  are regular expressions then  $(A \cup B)$  is a regular expression matched by any string that matches  $A$  or that matches  $B$  [or both].

If  $A, B$  are regular expressions then  $AB$  is a regular expression. matched by any string  $x$  such that  $x = yz$ ,  $y$  matches  $A$  and  $z$  matches  $B$ .

If  $A$  is a regular expression, then  $A^*$  is a regular expression. matched by any string that can be divided into 0 or more strings that match  $A$ .

## More Examples

$(0^*1^*)^*$

$0^*1^*$

$(0 \cup 1)^*(00 \cup 11)^*(0 \cup 1)^*$

$(00 \cup 11)^*$

## More Practice

You can also go the other way

Write a regular expression for "the set of all binary strings of odd length"

Write a regular expression for "the set of all binary strings with at most two ones"

Write a regular expression for "strings that don't contain 00"

## Induction: Hats!

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$

Inductive Hypothesis:

Inductive Step:

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$
