

CSE 311: Foundations of Computing

Lecture 20: CFGs, Relations

Last class: Context-Free Grammars

- A Context-Free Grammar (CFG) is given by a finite set of substitution rules involving
 - Alphabet Σ of *terminal symbols* that can't be replaced
 - A finite set V of *variables* that can be replaced
 - One variable, usually S , is called the *start symbol*
- The substitution rules involving a variable A , written as

$$A \rightarrow w_1 \mid w_2 \mid \cdots \mid w_k$$

where each w_i is a string of variables and terminals

- that is $w_i \in (V \cup \Sigma)^*$

Last class: How CFGs generate strings

- Begin with “S”
- If there is some variable **A** in the current string, you can replace it by one of the **w**’s in the rules for **A**
 - $A \rightarrow w_1 \mid w_2 \mid \cdots \mid w_k$
 - Write this as $xAy \Rightarrow xwy$
 - Repeat until no variables left
- The set of strings the CFG describes are all strings, containing no variables, that can be *generated* in this manner after a finite number of steps

Last class: Examples

Grammar	Language
$S \rightarrow 0S \mid S1 \mid \varepsilon$	0^*1^*
$S \rightarrow 0S0 \mid 1S1 \mid 0 \mid 1 \mid \varepsilon$	The set of all binary palindromes
$S \rightarrow 0S1 \mid \varepsilon$	$\{0^n 1^n : n \geq 0\}$
$S \rightarrow 0S11 \mid \varepsilon$	$\{0^n 1^{2n} : n \geq 0\}$
$S \rightarrow A10$ $A \rightarrow 0A1 \mid \varepsilon$	$\{0^n 1^{n+1} 0 : n \geq 0\}$
$S \rightarrow (S) \mid SS \mid \varepsilon$	The set of all strings of matched parentheses

Example Context-Free Grammars

Binary strings with equal numbers of 0s and 1s
(not just 0^n1^n , also 0101, 0110, etc.)

Example Context-Free Grammars

Binary strings with equal numbers of 0s and 1s
(not just 0^n1^n , also 0101, 0110, etc.)

$$S \rightarrow SS \mid 0S1 \mid 1S0 \mid \varepsilon$$

A standard structural induction can show that everything generated by S has an equal # of 0s and 1s

Intuitively, why does this generate all such strings?

Example Context-Free Grammars

Let $x \in \{0,1\}^*$. Define $f_x(k)$ to be the # of 0s minus # of 1s in the first k characters of x .

E.g., for $x = 011100$

$f_x(k) = 0$ when first k characters have #0s = #1s

– starts out at 0

$$f_x(0) = 0$$

– ends at 0

$$f_x(n) = 0$$

Example Context-Free Grammars

Three possibilities for $f_x(k)$ for $k \in \{1, \dots, n-1\}$

- $f_x(k) > 0$ for all such k

$$\mathbf{S} \rightarrow \mathbf{0S1}$$

- $f_x(k) < 0$ for all such k

$$\mathbf{S} \rightarrow \mathbf{1S0}$$

- $f_x(k) = 0$ for some such k

$$\mathbf{S} \rightarrow \mathbf{SS}$$

Simple Arithmetic Expressions

$E \rightarrow E + E \mid E * E \mid (E) \mid x \mid y \mid z \mid 0 \mid 1 \mid 2 \mid 3 \mid 4$
 $\mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

Generate $(2 * x) + y$

Simple Arithmetic Expressions

$E \rightarrow E + E \mid E * E \mid (E) \mid x \mid y \mid z \mid 0 \mid 1 \mid 2 \mid 3 \mid 4$
 $\mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

Generate $(2 * x) + y$

$E \Rightarrow E + E \Rightarrow (E) + E \Rightarrow (E * E) + E \Rightarrow (2 * E) + E \Rightarrow (2 * x) + E \Rightarrow (2 * x) + y$

Parse Trees

Suppose that grammar G generates a string x

- A *parse tree* of x for G has
 - Root labeled S (start symbol of G)
 - The children of any node labeled A are labeled by symbols of w left-to-right for some rule $A \rightarrow w$
 - The symbols of x label the leaves ordered left-to-right

$$S \rightarrow OSO \mid 1S1 \mid 0 \mid 1 \mid \varepsilon$$

Parse tree of 01110

Simple Arithmetic Expressions

$E \rightarrow E + E \mid E * E \mid (E) \mid x \mid y \mid z \mid 0 \mid 1 \mid 2 \mid 3 \mid 4$
 $\mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

Generate $x + y * z$ in two ways that give two *different* parse trees

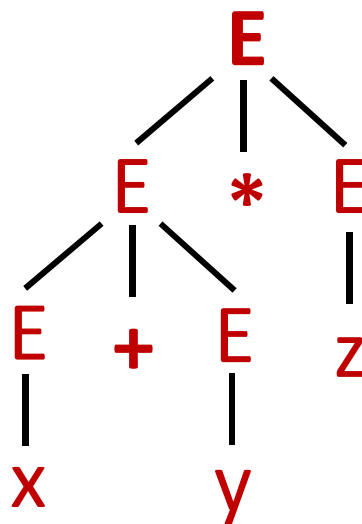

Simple Arithmetic Expressions

$$E \rightarrow E + E \mid E * E \mid (E) \mid x \mid y \mid z \mid 0 \mid 1 \mid 2 \mid 3 \mid 4 \\ \mid 5 \mid 6 \mid 7 \mid 8 \mid 9$$

Generate $x+y*z$ in ways that give two *different* parse trees

$E \Rightarrow E + E \Rightarrow x + E \Rightarrow x + E * E \Rightarrow x + y * E \Rightarrow x + y * z$
(add x to the product of y and z)

$E \Rightarrow E * E \Rightarrow E + E * E \Rightarrow x + E * E$
 $\Rightarrow x + y * E \Rightarrow x + y * z$
(add x to y , then multiply by z)

building precedence in simple arithmetic expressions

- **E** – expression (start symbol)
- **T** – term **F** – factor **I** – identifier **N** - number

E → **T** | **E+T**

T → **F** | **F*T**

F → (**E**) | **I** | **N**

I → **x** | **y** | **z**

N → **0** | **1** | **2** | **3** | **4** | **5** | **6** | **7** | **8** | **9**

building precedence in simple arithmetic expressions

- **E** – expression (start symbol)
- **T** – term **F** – factor **I** – identifier **N** - number

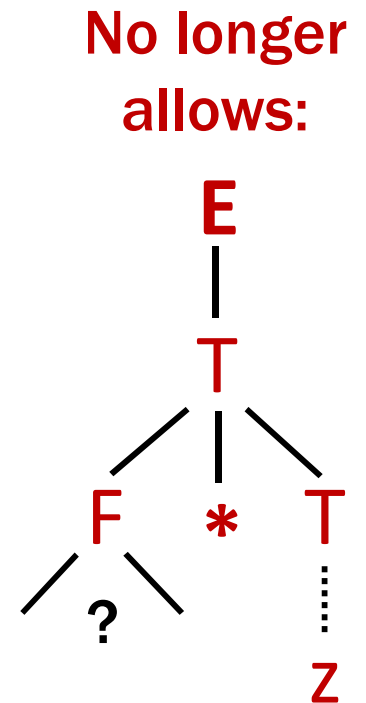

E → **T** | **E+T**

T → **F** | **F*T**

F → (**E**) | **I** | **N**

I → **x** | **y** | **z**

N → **0** | **1** | **2** | **3** | **4** | **5** | **6** | **7** | **8** | **9**

CFGs and recursively-defined sets of strings

- A CFG with the start symbol **S** as its *only* variable recursively defines the set of strings of terminals that **S** can generate
- A CFG with more than one variable is a simultaneous recursive definition of the sets of strings generated by *each* of its variables
 - sometimes necessary to use more than one

CFGs and regular expressions

Theorem: For all regular expressions A there is a CFG that generates precisely the strings A matches

Proof: Structural Induction

- **Basis:**
 - ϵ is a regular expression
 - a is a regular expression for any $a \in \Sigma$
- **Recursive step:**
 - If A and B are regular expressions then so are:
 - $A \cup B$
 - AB
 - A^*

CFGs can do everything REs can

- CFG to match RE ϵ

$$S \rightarrow \epsilon$$

- CFG to match RE a (for any $a \in \Sigma$)

$$S \rightarrow a$$

- **Basis:**

- ϵ is a regular expression
- a is a regular expression for any $a \in \Sigma$

- **Recursive step:**

- If A and B are regular expressions then so are:

$$A \cup B$$

$$AB$$

$$A^*$$

CFGs can do everything REs can

Suppose CFG with start symbol S_A matches RE **A**

CFG with start symbol S_B matches RE **B**

(Then rename variables so no vars used in both)

- CFG to match RE **$A \cup B$**

Add $S \rightarrow S_A \mid S_B$

+ rules from both CFGs

- CFG to match RE **AB**

Add $S \rightarrow S_A S_B$

+ rules from both CFGs

- **Basis:**

- ϵ is a regular expression

- a is a regular expression for any $a \in \Sigma$

- **Recursive step:**

- If A and B are regular expressions then so are:

- $A \cup B$

- AB

- A^*

CFGs can do everything that REs can

- CFG to match RE A^*
Add $S \rightarrow S_A S \mid \varepsilon$
+ rules from CFG with S_A

- **Basis:**
 - ε is a regular expression
 - a is a regular expression for any $a \in \Sigma$
- **Recursive step:**
 - If A and B are regular expressions then so are:
 - $A \cup B$
 - AB
 - A^*

Backus-Naur Form (The same thing...)

BNF (Backus-Naur Form) grammars

- Originally used to define programming languages
- Variables denoted by long names in angle brackets, e.g.
 - <identifier>, <if-then-else-statement>,
<assignment-statement>, <condition>
 - ::= used instead of \rightarrow

BNF for C

```
statement:
  ((identifier | "case" constant-expression | "default") ":")*
  (expression? ";" |
  block |
  "if" "(" expression ")" statement |
  "if" "(" expression ")" statement "else" statement |
  "switch" "(" expression ")" statement |
  "while" "(" expression ")" statement |
  "do" statement "while" "(" expression ")" ";" |
  "for" "(" expression? ";" expression? ";" expression? ")" statement |
  "goto" identifier ";" |
  "continue" ";" |
  "break" ";" |
  "return" expression? ";"
  )

block: "{" declaration* statement* "}"

expression:
  assignment-expression%

assignment-expression: (
  unary-expression (
    "=" | "*=" | "/=" | "%=" | "+=" | "-=" | "<<=" | ">>=" | "&=" |
    "^=" | "|="
  )
  )* conditional-expression

conditional-expression:
  logical-OR-expression ( "?" expression ":" conditional-expression )?
```

BNF for (Simple) English

Back to middle school:

<sentence> ::= <noun phrase> <verb phrase>

<noun phrase> ::= <article> <adjective> <noun>

<verb phrase> ::= <verb> <adverb> | <verb> <object>

<object> ::= <noun phrase>

Parse:

The yellow duck squeaked loudly

The red truck hit a parked car

So far: Languages — REs and CFGs

Two new ways of defining languages

- **Regular Expressions** $(0 \cup 1)^* 0110 (0 \cup 1)^*$
 - easy to understand (declarative)
- **Context-free Grammars** $S \rightarrow SS \mid 0S1 \mid 1S0 \mid \varepsilon$
 - more expressive
 - (a way of recursively-defining sets)

We will connect these to machines shortly.

But first, we need some new math terminology....

Relations and Directed Graphs

Relations

Let A and B be sets,

A **binary relation from A to B** is a subset of $A \times B$

Let A be a set,

A **binary relation on A** is a subset of $A \times A$

Relations You Already Know

\geq on \mathbb{N}

That is, $\{(x,y) : x \geq y \text{ and } x, y \in \mathbb{N}\}$

$<$ on \mathbb{R}

That is, $\{(x,y) : x < y \text{ and } x, y \in \mathbb{R}\}$

$=$ on Σ^*

That is, $\{(x,y) : x = y \text{ and } x, y \in \Sigma^*\}$

\subseteq on $\mathcal{P}(U)$ for universe U

That is, $\{(A,B) : A \subseteq B \text{ and } A, B \in \mathcal{P}(U)\}$

More Relation Examples

$$R_1 = \{(a, 1), (a, 2), (b, 1), (b, 3), (c, 3)\}$$

$$R_2 = \{(x, y) : x \equiv y \pmod{5}\}$$

$$R_3 = \{(c_1, c_2) : c_1 \text{ is a prerequisite of } c_2\}$$

$$R_4 = \{(s, c) : \text{student } s \text{ has taken course } c\}$$

Properties of Relations

Let R be a relation on A .

R is **reflexive** iff $(a,a) \in R$ for every $a \in A$

R is **symmetric** iff $(a,b) \in R$ implies $(b,a) \in R$

R is **antisymmetric** iff $(a,b) \in R$ and $a \neq b$ implies $(b,a) \notin R$

R is **transitive** iff $(a,b) \in R$ and $(b,c) \in R$ implies $(a,c) \in R$

Which relations have which properties?

\geq on \mathbb{N} :

$<$ on \mathbb{R} :

$=$ on Σ^* :

\subseteq on $\mathcal{P}(U)$:

$R_2 = \{(x, y) : x \equiv y \pmod{5}\}$:

$R_3 = \{(c_1, c_2) : c_1 \text{ is a prerequisite of } c_2 \}$:

R is **reflexive** iff $(a, a) \in R$ for every $a \in A$

R is **symmetric** iff $(a, b) \in R$ implies $(b, a) \in R$

R is **antisymmetric** iff $(a, b) \in R$ and $a \neq b$ implies $(b, a) \notin R$

R is **transitive** iff $(a, b) \in R$ and $(b, c) \in R$ implies $(a, c) \in R$

Which relations have which properties?

\geq on \mathbb{N} : Reflexive, Antisymmetric, Transitive

$<$ on \mathbb{R} : Antisymmetric, Transitive

$=$ on Σ^* : Reflexive, Symmetric, Antisymmetric, Transitive

\subseteq on $\mathcal{P}(U)$: Reflexive, Antisymmetric, Transitive

$R_2 = \{(x, y) : x \equiv y \pmod{5}\}$: Reflexive, Symmetric, Transitive

$R_3 = \{(c_1, c_2) : c_1 \text{ is a prerequisite of } c_2\}$: Antisymmetric

R is **reflexive** iff $(a, a) \in R$ for every $a \in A$

R is **symmetric** iff $(a, b) \in R$ implies $(b, a) \in R$

R is **antisymmetric** iff $(a, b) \in R$ and $a \neq b$ implies $(b, a) \notin R$

R is **transitive** iff $(a, b) \in R$ and $(b, c) \in R$ implies $(a, c) \in R$
