

```
public int Mystery(int m, int n){  
    if(m<n){  
        int temp = m;  
        m=n;  
        n=temp;  
    }  
    while(n != 0) {  
        int rem = m % n;  
        m=n;  
        n=rem;  
    }  
    return m;  
}
```

## Key Steps in RSA

Given two numbers, we can find their gcd quickly.

If we have an equation

$$ax \equiv b(\text{mod } n)$$

And  $\text{gcd}(a, n) = 1$  then we can quickly find a number to multiply the equation by to solve for  $x$ .

## How do we accomplish those steps?

That fact? You can prove it in the extra credit problem on HW5. It's a nice combination of lots of things we've done with modular arithmetic.

Let's talk about finding  $C = a^e \% n$ .

$e$  is a BIG number (about  $2^{16}$  is a common choice)

```
int total = 1;
for(int i = 0; i < e; i++){
    total = (a * total) % n;
}
```

## An application of all of this modular arithmetic

Amazon chooses random 512-bit (or 1024-bit) prime numbers  $p, q$  and an exponent  $e$  (often about 60,000).

Amazon calculates  $n = pq$ . They tell your computer  $(n, e)$  (not  $p, q$ )

You want to send Amazon your credit card number  $a$ .

You compute  $C = a^e \% n$  and send Amazon  $C$ .

Amazon computes  $d$ , the multiplicative inverse of  $e \pmod{[p-1][q-1]}$

Amazon finds  $C^d \% n$

Fact:  $a = C^d \% n$  as long as  $0 < a < n$  and  $p \nmid a$  and  $q \nmid a$
