

Warm up:

What is the following recursively-defined set?

**Basis Step:**  $4 \in S, 5 \in S$

**Recursive Step:** If  $x \in S$  and  $y \in S$  then  $x - y \in S$

# Structural Induction and Regular Expressions

CSE 311 Autumn 2025  
Lecture 19

**Trees!**

---

# More Structural Sets

Binary Trees are another common source of structural induction.

Basis: A single node is a rooted binary tree. ●

Recursive Step: If  $T_1$  and  $T_2$  are rooted binary trees with roots  $r_1$  and  $r_2$ , then a tree rooted at a new node, with children  $r_1, r_2$  is a binary tree.

# Functions on Binary Trees

$$\text{size}(\bullet) = 1$$

$$\text{size}\left(\begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ \triangleleft \quad \triangleright \\ T_1 \quad T_2 \end{array}\right) = \text{size}(T_1) + \text{size}(T_2) + 1$$

$$\text{height}(\bullet) = 0$$

$$\text{height}\left(\begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ \triangleleft \quad \triangleright \\ T_1 \quad T_2 \end{array}\right) = 1 + \max(\text{height}(T_1), \text{height}(T_2))$$

# Claim

We want to show that trees of a certain height can't have too many nodes. Specifically our claim is this:

For all trees  $T$ ,  $\text{size}(T) \leq 2^{\text{height}(T)+1} - 1$

Take a moment to absorb this formula, then we'll do induction!

# Structural Induction on Binary Trees

Let  $P(T)$  be " $\text{size}(T) \leq 2^{\text{height}(T)+1} - 1$ ". We show  $P(T)$  for all binary trees  $T$  by structural induction.

Base Case: Let  $T = \bullet$ .  $\text{size}(T)=1$  and  $\text{height}(T) = 0$ , so  $\text{size}(T)=1 \leq 2 - 1 = 2^{0+1} - 1 = 2^{\text{height}(T)+1} - 1$ .

Inductive Hypothesis: Suppose  $P(L)$  and  $P(R)$  hold for arbitrary trees  $L, R$ . Let  $T$  be the tree

Inductive step: Figure out, (1) what we must show (2) a formula for height and a formula for size of  $T$ .

# Structural Induction on Binary Trees (cont.)

Let  $P(T)$  be " $\text{size}(T) \leq 2^{\text{height}(T)+1} - 1$ ". We show  $P(T)$  for all binary trees  $T$  by structural induction.

$$\text{height}(T) = 1 + \max\{\text{height}(L), \text{height}(R)\}$$

$$\text{size}(T) = 1 + \text{size}(L) + \text{size}(R)$$

So  $P(T)$  holds, and we have  $P(T)$  for all binary trees  $T$  by the principle of induction.

# How do heights compare?

If  $L$  is taller than  $R$ ?

If  $L, R$  same height?

If  $R$  is taller than  $L$ ?

$$\text{height}(\bullet) = 0$$

$$\text{height}(\text{tree}) =$$

$$1 + \max(\text{height}(T_1), \text{height}(T_2))$$

# How do heights compare?

If  $L$  is taller than  $R$ ?

If  $L, R$  same height?

If  $R$  is taller than  $L$ ?

$$\text{height}(T) = \text{height}(L) + 1$$

$$\text{height}(T) = \text{height}(L) + 1$$

$$\text{height}(T) > \text{height}(L) + 1$$

$$\text{height}(T) > \text{height}(R) + 1$$

$$\text{height}(T) = \text{height}(R) + 1$$

$$\text{height}(T) = \text{height}(R) + 1$$

In all cases:  $\text{height}(T) \geq \text{height}(L) + 1$ ,  $\text{height}(T) \geq \text{height}(R) + 1$

# Structural Induction on Binary Trees (cont.)

Let  $P(T)$  be " $\text{size}(T) \leq 2^{\text{height}(T)+1} - 1$ ". We show  $P(T)$  for all binary trees  $T$  by structural induction.

$$\text{height}(T) = 1 + \max\{\text{height}(L), \text{height}(R)\}$$

$$\text{size}(T) = 1 + \text{size}(L) + \text{size}(R)$$

$$\text{size}(T) = 1 + \text{size}(L) + \text{size}(R) \leq 1 + 2^{\text{height}(L)+1} - 1 + 2^{\text{height}(R)+1} - 1 \quad (\text{by IH})$$

$$\leq 2^{\text{height}(L)+1} + 2^{\text{height}(R)+1} - 1 \quad (\text{cancel 1's})$$

$$\leq 2^{\text{height}(T)} + 2^{\text{height}(T)} - 1 = 2^{\text{height}(T)+1} - 1 \quad (T \text{ taller than subtrees})$$

So  $P(T)$  holds, and we have  $P(T)$  for all binary trees  $T$  by the principle of induction.

# Structural Induction Template

1. Define  $P()$  State that you will show  $P(x)$  holds for all  $x \in S$  and that your proof is by structural induction.
2. Base Case: Show  $P(b)$   
[Do that for every  $b$  in the basis step of defining  $S$ ]
3. Inductive Hypothesis: Suppose  $P(x)$   
[Do that for every  $x$  listed as already in  $S$  in the recursive rules].
4. Inductive Step: Show  $P()$  holds for the "new elements."  
[You will need a separate step for every element created by the recursive rules].
5. Therefore  $P(x)$  holds for all  $x \in S$  by the principle of induction.

# Structural Induction on Strings

# Strings

$\varepsilon$  is "the empty string"

The string with 0 characters – "" in Java (not null!)

$\Sigma^*$ :

Basis:  $\varepsilon \in \Sigma^*$ .

Recursive: If  $w \in \Sigma^*$  and  $a \in \Sigma$  then  $wa \in \Sigma^*$

$wa$  means the string of  $w$  with the character  $a$  appended.

You'll also see  $w \cdot a$  ( $a \cdot$  to mean "concatenate" i.e. + in Java)

# Functions on Strings

Since strings are defined recursively, most functions on strings are as well.

Length:

$$\text{len}(\varepsilon) = 0;$$

$$\text{len}(wa) = \text{len}(w) + 1 \text{ for } w \in \Sigma^*, a \in \Sigma$$

Reversal:

$$\varepsilon^R = \varepsilon;$$

$$(wa)^R = aw^R \text{ for } w \in \Sigma^*, a \in \Sigma$$

Concatenation

$$x \cdot \varepsilon = x \text{ for all } x \in \Sigma^*;$$

$$x \cdot (wa) = (x \cdot w)a \text{ for } w \in \Sigma^*, a \in \Sigma$$

Number of  $c$ 's in a string

$$\#_c(\varepsilon) = 0$$

$$\#_c(wc) = \#_c(w) + 1 \text{ for } w \in \Sigma^*;$$

$$\#_c(wa) = \#_c(w) \text{ for } w \in \Sigma^*, a \in \Sigma \setminus \{c\}.$$

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be "for all  $x \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ ."

Notice the strangeness of this  $P()$  there is a "for all  $x$ " inside the definition of  $P(y)$ .

That means we'll have to introduce an arbitrary  $x$  as part of the base case and the inductive step!

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case:

Inductive Hypothesis

Inductive Step:

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be " $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ ."

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step:

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be " $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ ."

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

...

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be " $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ ."

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

$$\begin{aligned} \text{len}(xy) &= \text{len}(xwa) = \text{len}(xw) + 1 \text{ (by definition of len)} \\ &= \text{len}(x) + \text{len}(w) + 1 \text{ (by IH)} \\ &= \text{len}(x) + \text{len}(wa) \text{ (by definition of len)} \end{aligned}$$

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

# Why all those arbitraries?

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

$P(\varepsilon)$  is a for-all statement, introduce arbitrary variable to show for-all.

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \varepsilon) = \text{len}(x) = \text{len}(x) + 0 = \text{len}(x) + \text{len}(\varepsilon)$

Needs to be arbitrary because it's in the IH (induction wouldn't show “all strings” otherwise)

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

$\text{len}(xy) = \text{len}(xwa) = \text{len}(xw) + 1$  (by definition of  $\text{len}$ )

Recursive rule says “every  $a \in \Sigma$ ” so we need to argue for every  $a$ .

$= \text{len}(x) + \text{len}(w) + 1$  (by IH)

$= \text{len}(x) + \text{len}(wa)$  (by definition of  $\text{len}$ )

$P(y)$  is a for-all statement, introduce arbitrary variable to show for-all.

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all strings  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

## **A few last comments**

# What does the inductive step look like?

Here's a recursively-defined set:

**Basis:**  $0 \in T$  and  $5 \in T$

**Recursive:** If  $x, y \in T$  then  $x + y \in T$  and  $x - y \in T$ .

Let  $P(x)$  be " $5|x$ "

What does the inductive step look like?

Well there's two recursive rules, so we have two things to show

# Just the IS (you still need the other steps)

Let  $t$  be an arbitrary element of  $T$  not covered by the base case. By the exclusion rule  $t = x + y$  or  $t = x - y$  for  $x, y \in T$ .

Inductive hypothesis: Suppose  $P(x)$  and  $P(y)$  hold.

Case 1:  $t = x + y$

By IH  $5|x$  and  $5|y$  so  $5a = x$  and  $5b = y$  for integers  $a, b$ .

Adding, we get  $x + y = 5a + 5b = 5(a + b)$ . Since  $a, b$  are integers, so is  $a + b$ , and  $P(x + y)$ , i.e.  $P(t)$ , holds.

Case 2:  $t = x - y$

By IH  $5|x$  and  $5|y$  so  $5a = x$  and  $5b = y$  for integers  $a, b$ .

Subtracting, we get  $x - y = 5a - 5b = 5(a - b)$ . Since  $a, b$  are integers, so is  $a - b$ , and  $P(x - y)$ , i.e.,  $P(t)$ , holds.

In all cases, we have  $P(t)$ . By the principle of induction,  $P(x)$  holds for all  $x \in T$ .

# If you don't have a recursively-defined set

You won't do structural induction.

You can do weak or strong induction though.

For example, Let  $P(n)$  be "for all elements of  $S$  of "size"  $n$  <something> is true"

To prove "for all  $x \in S$  of size  $n$ ..." you need to start with "let  $x$  be an arbitrary element of size  $k + 1$  in your IS.

You CAN'T start with size  $k$  and "build up" to an arbitrary element of size  $k + 1$  it isn't arbitrary.

## Extra Practice

---

# Induction: Hats!

You have  $n$  people in a line ( $n \geq 2$ ). Each of them wears either a **purple hat** or a **gold hat**. The person at the front of the line wears a purple hat. The person at the back of the line wears a gold hat.

Show that for every arrangement of the line satisfying the rule above, there is a person with a purple hat next to someone with a gold hat.

Yes, this is kinda obvious. I promise this is good induction practice.

Yes, you could argue this by contradiction. I promise this is good induction practice.

# Induction: Hats!

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$

Inductive Hypothesis:

Inductive Step:

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$

# Induction: Hats!

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$  The line must be just a person with a purple hat and a person with a gold hat, who are next to each other.

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 2$ .

Inductive Step: Consider an arbitrary line with  $k + 1$  people in purple and gold hats, with a gold hat at one end and a purple hat at the other.

Target: there is someone in a purple hat next to someone in a gold hat.

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$

# Induction: Hats!

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$  The line must be just a person with a purple hat and a person with a gold hat, who are next to each other.

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 2$ .

Inductive Step: Consider an arbitrary line with  $k + 1$  people in purple and gold hats, with a gold hat at one end and a purple hat at the other.

Case 1: There is someone with a purple hat next to the person in the gold hat at one end. Then those people are the required adjacent opposite hats.

Case 2: There is a person with a gold hat next to the person in the gold hat at the end. Then the line from the second person to the end is length  $k$ , has a gold hat at one end and a purple hat at the other. Applying the inductive hypothesis, there is an adjacent, opposite-hat wearing pair.

In either case we have  $P(k + 1)$ .

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$
