# Recursively Defined Functions: Fibonacci

Just like induction works well with recursive code, it also works well for recursively-defined functions.

Define the Fibonacci numbers as follows:

$$f(0) = 1$$

$$f(1) = 1$$

$$f(n) = f(n - 1) + f(n - 2) \text{ for all } n \in \mathbb{N}, n \geq 2.$$

\*This is a somewhat unusual definition,  $f(0) = 0, f(1) = 1$  is more common.

# Fibonacci Inequality: goal

Show that  $f(n) \leq 2^n$  for all  $n \geq 0$  by induction.

$$f(0) = 1; \quad f(1) = 1$$
$$f(n) = f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2.$$

# Fibonacci Inequality: skeleton

Show that  $f(n) \leq 2^n$  for all  $n \geq 0$  by induction.

Define  $P(n)$  to be " $f(n) \leq 2^n$ " We show  $P(n)$  is true for all  $n \geq 0$  by induction on  $n$ .

Base Cases: ( $n = 0$ ):  $f(0) = 1 \leq 1 = 2^0$ .

( $n = 1$ ):  $f(1) = 1 \leq 2 = 2^1$ .

Inductive Hypothesis: Suppose  $P(0) \wedge P(1) \wedge \dots \wedge P(k)$  for an arbitrary  $k \geq 1$ .

Inductive step:

Target:  $P(k + 1)$ . i.e.  $f(k + 1) \leq 2^{k+1}$

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Fibonacci Inequality

Show that  $f(n) \leq 2^n$  for all  $n \geq 0$  by induction.

Define  $P(n)$  to be " $f(n) \leq 2^n$ ". We show  $P(n)$  is true for all  $n \geq 0$  by induction on  $n$ .

Base Cases: ( $n = 0$ ):  $f(0) = 1 \leq 1 = 2^0$ .

( $n = 1$ ):  $f(1) = 1 \leq 2 = 2^1$ .

Inductive Hypothesis: Suppose  $P(0) \wedge P(1) \wedge \dots \wedge P(k)$  for an arbitrary  $k \geq 1$ .

Inductive step:  $f(k+1) = f(k) + f(k-1)$  by the definition of the Fibonacci numbers. Applying IH twice, we have  $f(k+1) \leq 2^k + 2^{k-1} < 2^k + 2^k = 2^{k+1}$ .

Therefore, we have  $P(n)$  for all  $n \geq 0$  by the principle of induction.

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Induction: Hats! (goal)

You have  $n$  people in a line ( $n \geq 2$ ). Each of them wears either a **purple hat** or a **gold hat**. The person at the front of the line wears a purple hat. The person at the back of the line wears a gold hat.

Show that for every arrangement of the line satisfying the rule above, there is a person with a purple hat next to someone with a gold hat.

Yes this is kinda obvious. I promise this is good induction practice.

Yes you could argue this by contradiction. I promise this is good induction practice.

What is  $P(n)$ ?

# Induction: Hats! ( $P(n)$ )

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$

Inductive Hypothesis:

Inductive Step:

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$

# Induction: Hats! (base case, IH)

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$  The line must be just a person with a purple hat and a person with a gold hat, who are next to each other.

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 2$ .

Inductive Step: Consider an arbitrary line with  $k + 1$  people in purple and gold hats, with a gold hat at one end and a purple hat at the other.

Target: there is someone in a purple hat next to someone in a gold hat.

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$

# Induction: Hats! (complete)

Define  $P(n)$  to be "in every line of  $n$  people with gold and purple hats, with a purple hat at one end and a gold hat at the other, there is a person with a purple hat next to someone with a gold hat"

We show  $P(n)$  for all integers  $n \geq 2$  by induction on  $n$ .

Base Case:  $n = 2$  The line must be just a person with a purple hat and a person with a gold hat, who are next to each other.

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 2$ .

Inductive Step: Consider an arbitrary line with  $k + 1$  people in purple and gold hats, with a gold hat at one end and a purple hat at the other.

Case 1: There is someone with a purple hat next to the person in the gold hat at one end. Then those people are the required adjacent opposite hats.

Case 2: There is a person with a gold hat next to the person in the gold hat at the end. Then the line from the second person to the end is length  $k$ , has a gold hat at one end and a purple hat at the other. Applying the inductive hypothesis, there is an adjacent, opposite-hat wearing pair.

In either case we have  $P(k + 1)$ .

By the principle of induction, we have  $P(n)$  for all  $n \geq 2$

# Structural Induction on Strings

---

# Strings

$\varepsilon$  is "the empty string"

The string with 0 characters – "" in Java (not null!)

$\Sigma^*$ :

Basis:  $\varepsilon \in \Sigma^*$ .

Recursive: If  $w \in \Sigma^*$  and  $a \in \Sigma$  then  $wa \in \Sigma^*$

$wa$  means the string of  $w$  with the character  $a$  appended.

You'll also see  $w \cdot a$  ( $a \cdot$  to mean "concatenate" i.e. + in Java)

# Functions on Strings

Since strings are defined recursively, most functions on strings are as well.

Length:

$$\text{len}(\varepsilon) = 0;$$

$$\text{len}(wa) = \text{len}(w) + 1 \text{ for } w \in \Sigma^*, a \in \Sigma$$

Reversal:

$$\varepsilon^R = \varepsilon;$$

$$(wa)^R = aw^R \text{ for } w \in \Sigma^*, a \in \Sigma$$

Concatenation

$$x \cdot \varepsilon = x \text{ for all } x \in \Sigma^*;$$

$$x \cdot (wa) = (x \cdot w)a \text{ for } w \in \Sigma^*, a \in \Sigma$$

Number of  $c$ 's in a string

$$\#_c(\varepsilon) = 0$$

$$\#_c(wc) = \#_c(w) + 1 \text{ for } w \in \Sigma^*;$$

$$\#_c(wa) = \#_c(w) \text{ for } w \in \Sigma^*, a \in \Sigma \setminus \{c\}.$$

String proof:

Claim for all  $x, y \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ .

Let  $P(y)$  be "for all  $x \in \Sigma^*$   $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$ ."

Notice the strangeness of this  $P()$  there is a "for all  $x$ " inside the definition of  $P(y)$ .

That means we'll have to introduce an arbitrary  $x$  as part of the base case and the inductive step!

# String proof: skeleton

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case:

Inductive Hypothesis

Inductive Step:

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

# String proof: Base case, IH

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step:

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

# String proof: Inductive Step Setup

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

...

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

# String proof: complete

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \epsilon) = \text{len}(x)$   
 $= \text{len}(x) + 0 = \text{len}(x) + \text{len}(\epsilon)$

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

$\text{len}(xy) = \text{len}(xwa) = \text{len}(xw) + 1$  (by definition of  $\text{len}$ )

$= \text{len}(x) + \text{len}(w) + 1$  (by IH)

$= \text{len}(x) + \text{len}(wa)$  (by definition of  $\text{len}$ )

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all string  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

# Why all those arbitraries?

Let  $P(y)$  be “ $\text{len}(x \cdot y) = \text{len}(x) + \text{len}(y)$  for all  $x \in \Sigma^*$ .”

$P(\varepsilon)$  is a for-all statement, introduce arbitrary variable to show for-all.

We prove  $P(y)$  for all  $x \in \Sigma^*$  by structural induction.

Base Case: Let  $x$  be an arbitrary string,  $\text{len}(x \cdot \varepsilon) = \text{len}(x) = \text{len}(x) + 0 = \text{len}(x) + \text{len}(\varepsilon)$

Needs to be arbitrary because it's in the IH (induction wouldn't show “all strings” otherwise)

Inductive Hypothesis: Suppose  $P(w)$  for an arbitrary string  $w$ .

Inductive Step: Let  $y = wa$  for an arbitrary  $a \in \Sigma$ . We show  $P(y)$ . Let  $x$  be an arbitrary string.

$\text{len}(xy) = \text{len}(xwa) = \text{len}(xw) + 1$  (by definition of  $\text{len}$ )

Recursive rule says “every  $a \in \Sigma$ ” so we need to argue for every  $a$ .

$= \text{len}(x) + \text{len}(w) + 1$  (by IH)

$= \text{len}(x) + \text{len}(wa)$  (by definition of  $\text{len}$ )

$P(y)$  is a for-all statement, introduce arbitrary variable to show for-all.

Therefore,  $\text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

We conclude that  $P(y)$  holds for all strings  $y$  by the principle of induction. Unwrapping the definition of  $P$ , we get  $\forall x \forall y \in \Sigma^* \text{len}(xy) = \text{len}(x) + \text{len}(y)$ , as required.

**More Practice**

---

Claim:  $3 \mid (2^{2n} - 1)$  for all  $n \in \mathbb{N}$ . (structure)

[Define  $P(n)$ ]

Base Case

Inductive Hypothesis

Inductive Step

[conclusion]

Claim:  $3 \mid (2^{2^n} - 1)$  for all  $n \in \mathbb{N}$ . (1)

Let  $P(n)$  be " $3 \mid (2^{2^n} - 1)$ ." We show  $P(n)$  holds for all  $n \in \mathbb{N}$ .

Base Case ( $n = 0$ ) note that  $2^{2^n} - 1 = 2^0 - 1 = 0$ . Since  $3 \cdot 0 = 0$ , and 0 is an integer,  $3 \mid (2^{2 \cdot 0} - 1)$ .

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 0$

Inductive Step:

Target:  $P(k + 1)$ , i.e.  $3 \mid (2^{2^{(k+1)}} - 1)$

Therefore, we have  $P(n)$  for all  $n \in \mathbb{N}$  by the principle of induction.

**Claim:**  $3 \mid (2^{2n} - 1)$  for all  $n \in \mathbb{N}$ . (2)

Let  $P(n)$  be " $3 \mid (2^{2n} - 1)$ ." We show  $P(n)$  holds for all  $n \in \mathbb{N}$ .

Base Case ( $n = 0$ ) note that  $2^{2n} - 1 = 2^0 - 1 = 0$ . Since  $3 \cdot 0 = 0$ , and 0 is an integer,  $3 \mid (2^{2 \cdot 0} - 1)$ .

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 0$

Inductive Step: By inductive hypothesis,  $3 \mid (2^{2k} - 1)$ . i.e. there is an integer  $j$  such that  $3j = 2^{2k} - 1$ .

$$2^{2(k+1)} - 1 = 4 \cdot 2^{2k} - 1$$

**FORCE the expression in your IH to appear**

Target:  $P(k + 1)$ , i.e.  $3 \mid (2^{2(k+1)} - 1)$

Therefore, we have  $P(n)$  for all  $n \in \mathbb{N}$  by the principle of induction.

# Claim: $3 \mid (2^{2^n} - 1)$ for all $n \in \mathbb{N}$ . (3)

Let  $P(n)$  be " $3 \mid (2^{2^n} - 1)$ ." We show  $P(n)$  holds for all  $n \in \mathbb{N}$ .

Base Case ( $n = 0$ ) note that  $2^{2^n} - 1 = 2^0 - 1 = 0$ . Since  $3 \cdot 0 = 0$ , and  $0$  is an integer,  $3 \mid (2^{2 \cdot 0} - 1)$ .

Inductive Hypothesis: Suppose  $P(k)$  holds for an arbitrary  $k \geq 0$

Inductive Step: By inductive hypothesis,  $3 \mid (2^{2^k} - 1)$ . i.e. there is an integer  $j$  such that  $3j = 2^{2^k} - 1$ .

$$2^{2^{(k+1)}} - 1 = 4 \cdot 2^{2^k} - 1 = 4(2^{2^k} - 1) + 4 - 1$$

By IH, we can replace  $2^{2^k} - 1$  with  $3j$  for an integer  $j$

$$2^{2^{(k+1)}} - 1 = 4(3j) + 4 - 1 = 3(4j) + 3 = 3(4j + 1)$$

Since  $4j + 1$  is an integer, we meet the definition of divides and we have:

Target:  $P(k + 1)$ , i.e.  $3 \mid (2^{2^{(k+1)}} - 1)$

Therefore, we have  $P(n)$  for all  $n \in \mathbb{N}$  by the principle of induction.

# Claim: $3 \mid (2^{2^n} - 1)$ for all $n \in \mathbb{N}$ . (intuition)

That inductive step might still seem like magic.

It sometimes helps to run through examples, and look for patterns:

$$2^{2 \cdot 0} - 1 = 0 = 3 \cdot 0$$

$$2^{2 \cdot 1} - 1 = 3 = 3 \cdot 1$$

$$2^{2 \cdot 2} - 1 = 15 = 3 \cdot 5$$

$$2^{2 \cdot 3} - 1 = 63 = 3 \cdot 21$$

$$2^{2 \cdot 4} - 1 = 255 = 3 \cdot 85$$

$$2^{2 \cdot 5} - 1 = 1023 = 3 \cdot 341$$

The divisor goes from  $k$  to  $4k + 1$

$$0 \rightarrow 4 \cdot 0 + 1 = 1$$

$$1 \rightarrow 4 \cdot 1 + 1 = 5$$

$$5 \rightarrow 4 \cdot 5 + 1 = 21$$

...

That might give us a hint that  $4k + 1$  will be in the algebra somewhere, and give us another intermediate target.

# Fibonacci Inequality Two (structure)

Show that  $f(n) \geq 2^{n/2}$  for all  $n \geq 2$  by induction.

[Define  $P(n)$ ]

Base Cases:

Inductive Hypothesis:

Inductive step:

Therefore, we have  $P(n)$  for all  $n \geq 0$  by the principle of induction.

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Fibonacci Inequality Two (1)

Show that  $f(n) \geq 2^{n/2}$  for all  $n \geq 2$  by induction.

Define  $P(n)$  to be " $f(n) \geq 2^{n/2}$ " We show  $P(n)$  is true for all  $n \geq 2$  by induction on  $n$ .

Base Cases:  $f(2) = f(1) + f(0) = 2 \geq 2 = 2^1 = 2^{2/2}$

$$f(3) = f(2) + f(1) = 2 + 1 = 3 = 2 \cdot \frac{3}{2} \geq 2\sqrt{2} = 2^{1.5} = 2^{3/2}$$

Inductive Hypothesis: Suppose  $P(2) \wedge P(3) \wedge \dots \wedge P(k)$  for an arbitrary  $k \geq 3$ .

Inductive step:  $f(k+1) = f(k) + f(k-1)$  by the definition of the Fibonacci numbers. Applying IH twice, we have

Target:  $f(k+1) \geq 2^{(k+1)/2}$

Therefore, we have  $P(n)$  for all  $n \geq 0$  by the principle of induction.

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Fibonacci Inequality Two (2)

Show that  $f(n) \geq 2^{n/2}$  for all  $n \geq 2$  by induction.

Define  $P(n)$  to be " $f(n) \geq 2^{n/2}$ " We show  $P(n)$  is true for all  $n \geq 2$  by induction on  $n$ .

Base Cases:  $f(2) = f(1) + f(0) = 2 \geq 2 = 2^1 = 2^{2/2}$

$$f(3) = f(2) + f(1) = 2 + 1 = 3 = 2 \cdot \frac{3}{2} \geq 2\sqrt{2} = 2^{1.5} = 2^{3/2}$$

Inductive Hypothesis: Suppose  $P(2) \wedge P(3) \wedge \dots \wedge P(k)$  for an arbitrary  $k \geq 3$ .

Inductive step:  $f(k+1) = f(k) + f(k-1)$  by the definition of the Fibonacci numbers. Applying IH twice, we have

$$f(k+1) \geq 2^{k/2} + 2^{(k-1)/2}$$

$$\geq 2^{(k+1)/2}$$

Therefore, we have  $P(n)$  for all  $n \geq 0$  by the principle of induction.

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Fibonacci Inequality Two (3)

Show that  $f(n) \geq 2^{n/2}$  for all  $n \geq 2$  by induction.

Define  $P(n)$  to be " $f(n) \geq 2^{n/2}$ " We show  $P(n)$  is true for all  $n \geq 2$  by induction on  $n$ .

Base Cases:  $f(2) = f(1) + f(0) = 2 \geq 2 = 2^1 = 2^{2/2}$

$$f(3) = f(2) + f(1) = 2 + 1 = 3 = 2 \cdot \frac{3}{2} \geq 2\sqrt{2} = 2^{1.5} = 2^{3/2}$$

Inductive Hypothesis: Suppose  $P(2) \wedge P(3) \wedge \dots \wedge P(k)$  for an arbitrary  $k \geq 3$ .

Inductive step:  $f(k+1) = f(k) + f(k-1)$  by the definition of the Fibonacci numbers. Applying IH twice, we have

$$\begin{aligned} f(k+1) &\geq 2^{k/2} + 2^{(k-1)/2} \\ &= 2^{(k-1)/2}(\sqrt{2} + 1) \\ &\geq 2^{(k-1)/2} \cdot 2 \\ &\geq 2^{(k+1)/2} \end{aligned}$$

Therefore, we have  $P(n)$  for all  $n \geq 0$  by the principle of induction.

$$\begin{aligned} f(0) &= 1; & f(1) &= 1 \\ f(n) &= f(n-1) + f(n-2) \text{ for all } n \in \mathbb{N}, n \geq 2. \end{aligned}$$

# Even More Induction Practice: $g(n)$ and $h(n)$ (1)

$$\text{Let } g(n) = \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n-1) & \text{otherwise} \end{cases}$$

$$\text{Let } h(n) = n^n$$

Claim:  $h(n) \geq g(n)$  for all integers  $n \geq 1$

# Even More Induction Practice: $g(n)$ and $h(n)$ (2)

Define  $P(n)$  to be " $h(n) \geq g(n)$  for all integers  $n \geq 1$ "

We show  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

Base Case

Inductive Hypothesis:

Inductive Step:

Thus  $P(k + 1)$  holds.

Therefore, we have  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

$$\begin{aligned} \text{Let } g(n) &= \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n - 1) & \text{otherwise} \end{cases} \\ \text{Let } h(n) &= n^n \end{aligned}$$

# Even More Induction Practice: $g(n)$ and $h(n)$ (3)

Define  $P(n)$  to be " $h(n) \geq g(n)$  for all integers  $n \geq 1$ "

We show  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

Base Case ( $n = 1$ ):  $h(n) = 1^1 = 1 \geq 1 = 1 \cdot 1 = 1 \cdot g(0) = g(1)$ .

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 1$ .

Inductive Step:

$$g(k + 1) = (k + 1) \cdot g(k)$$

$$= (k + 1)^{k+1}.$$

Thus  $P(k + 1)$  holds.

Therefore, we have  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

$$\begin{aligned} \text{Let } g(n) &= \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n - 1) & \text{otherwise} \end{cases} \\ \text{Let } h(n) &= n^n \end{aligned}$$

# Even More Induction Practice: $g(n)$ and $h(n)$ (4)

Define  $P(n)$  to be " $h(n) \geq g(n)$  for all integers  $n \geq 1$ "

We show  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

Base Case ( $n = 1$ ):  $h(n) = 1^1 = 1 \geq 1 = 1 \cdot 1 = 1 \cdot g(0) = g(1)$ .

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 1$ .

Inductive Step:

$$\begin{aligned} g(k+1) &= (k+1) \cdot g(k) \\ &\leq (k+1) \cdot h(k) \text{ by IH.} \end{aligned}$$

$$= (k+1)^{k+1}.$$

Thus  $P(k+1)$  holds.

Therefore, we have  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

$$\begin{aligned} \text{Let } g(n) &= \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n-1) & \text{otherwise} \end{cases} \\ \text{Let } h(n) &= n^n \end{aligned}$$

# Even More Induction Practice: $g(n)$ and $h(n)$ (5)

Define  $P(n)$  to be " $h(n) \geq g(n)$  for all integers  $n \geq 1$ "

We show  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

Base Case ( $n = 1$ ):  $h(n) = 1^1 = 1 \geq 1 = 1 \cdot 1 = 1 \cdot g(0) = g(1)$ .

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 1$ .

Inductive Step:

$$\begin{aligned}g(k + 1) &= (k + 1) \cdot g(k) \\ &\leq (k + 1) \cdot h(k) && \text{by IH.} \\ &\leq (k + 1) \cdot k^k && \text{by definition of } h(k) \\ &\leq (k + 1) \cdot (k + 1)^k \\ &= (k + 1)^{k+1}.\end{aligned}$$

Thus  $P(k + 1)$  holds.

Therefore, we have  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

$$\begin{aligned}\text{Let } g(n) &= \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n - 1) & \text{otherwise} \end{cases} \\ \text{Let } h(n) &= n^n\end{aligned}$$

# Even More Induction Practice: $g(n)$ and $h(n)$ (6)

Define  $P(n)$  to be " $h(n) \geq g(n)$  for all integers  $n \geq 1$ "

We show  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

Base Case ( $n = 1$ ):  $h(n) = 1^1 = 1 \geq 1 = 1 \cdot 1 = 1 \cdot g(0) = g(1)$ .

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 1$ .

Inductive Step:

$$\begin{aligned} g(k+1) &= (k+1) \cdot g(k) \\ &\leq (k+1) \cdot h(k) && \text{by IH.} \\ &\leq (k+1) \cdot k^k && \text{by definition of } h(k) \\ &\leq (k+1) \cdot (k+1)^k \\ &= (k+1)^{k+1}. \end{aligned}$$

Thus  $P(k+1)$  holds.

Therefore, we have  $P(n)$  for all  $n \geq 1$  by induction on  $n$ .

$$\begin{aligned} \text{Let } g(n) &= \begin{cases} 1 & \text{if } n = 0 \\ n \cdot g(n-1) & \text{otherwise} \end{cases} \\ \text{Let } h(n) &= n^n \end{aligned}$$

# Even More Induction Practice: Sums (1)

Let  $P(n)$  be  $\sum_{i=0}^n 2 + 3i = \frac{(n+1)(3n+4)}{2}$

Show  $P(n)$  for all  $n \in \mathbb{N}$  by induction on  $n$ .

Base Case ( $n = 0$ ):

Inductive Hypothesis:

Inductive Step:

[Conclusion]

# Even More Induction Practice: Sums (2)

Let  $P(n)$  be  $\sum_{i=0}^n 2 + 3i = \frac{(n+1)(3n+4)}{2}$

Show  $P(n)$  for all  $n \in \mathbb{N}$  by induction on  $n$ .

Base Case ( $n = 0$ ):  $\sum_{i=0}^0 2 + 3i = 2 = \frac{4}{2} = \frac{(0+1)(3 \cdot 0 + 4)}{2}$

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 0$ .

Inductive Step:

Target:  $\sum_{i=0}^{k+1} 2 + 3i = \frac{([k+1]+1)(3[k+1]+4)}{2}$

# Even More Induction Practice: Sums (3)

Let  $P(n)$  be  $\sum_{i=0}^n 2 + 3i = \frac{(n+1)(3n+4)}{2}$

Show  $P(n)$  for all  $n \in \mathbb{N}$  by induction on  $n$ .

Base Case ( $n = 0$ ):  $\sum_{i=0}^0 2 + 3i = 2 = \frac{4}{2} = \frac{(0+1)(3 \cdot 0 + 4)}{2}$

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 0$ .

Inductive Step:

$\sum_{i=0}^{k+1} 2 + 3i = (\sum_{i=0}^k 2 + 3i) + (2 + 3(k + 1))$ . By IH, we have:

$$\sum_{i=0}^{k+1} 2 + 3i = \frac{(k+1)(3k+4)}{2} + 2 + 3k + 3 = \text{????}$$

$$= \frac{([k + 1] + 1)(3[k + 1] + 4)}{2}$$

# Even More Induction Practice: Sums (4)

Let  $P(n)$  be  $\sum_{i=0}^n 2 + 3i = \frac{(n+1)(3n+4)}{2}$

Show  $P(n)$  for all  $n \in \mathbb{N}$  by induction on  $n$ .

Base Case ( $n = 0$ ):  $\sum_{i=0}^0 2 + 3i = 2 = \frac{4}{2} = \frac{(0+1)(3 \cdot 0 + 4)}{2}$

Inductive Hypothesis: Suppose  $P(k)$  is true for an arbitrary  $k \geq 0$ .

Inductive Step:

$\sum_{i=0}^{k+1} 2 + 3i = (\sum_{i=0}^k 2 + 3i) + (2 + 3(k+1))$ . By IH, we have:

$$\begin{aligned} \sum_{i=0}^{k+1} 2 + 3i &= \frac{(k+1)(3k+4)}{2} + 2 + 3k + 3 = \frac{3k^2 + 7k + 4}{2} + \frac{6k + 10}{2} = \frac{3k^2 + 13k + 14}{2} = \\ &= \frac{(3k+7)(k+2)}{2} = \frac{([k+1]+1)(3[k+1]+4)}{2} \end{aligned}$$

Therefore,  $P(n)$  holds for all  $n \in \mathbb{N}$  by induction on  $n$ .
