## **CSE 312: Foundations of Computing II**

**QuickCheck: Random Variables, Linearity of Expectation (due Thursday, April** 19)

Name:

## 0. Double the Die, Square the Sum!

Consider the following program:

```
1 def experiment():
2   die1 = RollDie(3)
3   die2 = RollDie(2)
4   result = (die1 + die2)<sup>2</sup>
5   return result
```

We want to analyze the return value of this program by modeling it with random variables. Let  $D_1, D_2, X$  each represent the value of the first die, the value of the second die, and the returned value.

(a) Find the codomain of X and  $p_X(k)$ , the probability mass function for X.

(b) Find  $\mathbb{E}[X]$  by definition of expectation.

(c) Sharpnel insisted on using linearity of expectation to find  $\mathbb{E}[X]$ . He wrote the following:

$$\mathbb{E}[D_1] = \frac{1}{3} \cdot 1 + \frac{1}{3} \cdot 2 + \frac{1}{3} \cdot 3 = 2 \tag{1}$$

$$\mathbb{E}[D_2] = \frac{1}{2} \cdot 1 + \frac{1}{2} \cdot 2 = 1.5$$
(2)

$$\mathbb{E}[X] = \mathbb{E}\left[(D_1 + D_2)^2\right] \tag{3}$$

$$= \mathbb{E} \left[ D_1^2 + 2D_1 D_2 + D_2^2 \right]$$
(4)

$$= (\mathbb{E}[D_1])^2 + 2\mathbb{E}[D_1]\mathbb{E}[D_2] + (\mathbb{E}[D_2])^2$$
(5)

$$=2^2 + 2 \times 2 \times 1.5 + 1.5^2 \tag{6}$$

If he is correct, say so. Else find the first line where he made an error and explain your reasoning briefly.
