

CSE 312: Foundations of Computing II

Quiz Section #5: Midterm review

Review of Concepts

Expectation (expected value, mean, or average): The expectation of a discrete random variable is defined to be $\mathbb{E}[X] = \underline{\hspace{2cm}}$. The expectation of a function of a discrete random variable $g(X)$ is $\mathbb{E}[g(X)] = \underline{\hspace{2cm}}$.

Linearity of Expectation: Let X and Y be random variables, and $a, b, c \in \mathbb{R}$. Then, $\mathbb{E}[aX + bY + c] = \underline{\hspace{2cm}}$.

To take advantage of Linearity of Expectation, it is often helpful to write a variable X as a sum of **indicator variables**, which are of the following form:

$$X_i = \begin{cases} \underline{\hspace{1cm}}, & \text{if some condition is met for object } i \\ \underline{\hspace{1cm}}, & \text{otherwise} \end{cases}$$

Then, $\mathbb{E}[X] = \mathbb{E}[\sum_i X_i] = \sum_i \mathbb{E}[X_i] = \underline{\hspace{2cm}}$.

Variance: Let X be a random variable and $\mu = \mathbb{E}[X]$. The variance of X is defined to be $\text{Var}(X) = \underline{\hspace{2cm}}$. Notice that since this is an expectation of a random variable $((X - \mu)^2)$, variance is always non-negative. With some algebra, we can simplify this to $\text{Var}(X) = \mathbb{E}[X^2] - \mathbb{E}[X]^2$.

Property of Variance: Let $a, b \in \mathbb{R}$ and X a random variable. Then, $\text{Var}(aX + b) = \underline{\hspace{2cm}}$.

Exercises on Expectation and Variance

1. Let the random variable X be the sum of two independent rolls of a fair 3-sided die. (If you are having trouble imagining what that looks like, you can use a 6-sided die and change the numbers on 3 of its faces.)
 - (a) What is the probability mass function of X ?
 - (b) Find $\mathbb{E}[X]$ directly by applying the definition of expectation to the result from part (a).
 - (c) Find $\mathbb{E}[X]$ again using linearity of expectation.
 - (d) Now compute $\text{Var}(X)$ two ways: (1) using the definition $\text{Var}(X) = \mathbb{E}[(X - \mu)^2]$, and (2) using the formula $\text{Var}(X) = \mathbb{E}[X^2] - (\mathbb{E}[X])^2$.

2. You are playing a game at a primitive casino. To play, you must pay \$20 initially. Then, you roll one fair 6-sided dice, and you are paid 5 times the value you roll. Let M be the amount of money you earn as profit from playing the game once. Compute $\mathbb{E}[M]$ and $\text{Var}(M)$. Use the fact that if X is the value of a single roll of a fair 6-sided dice, $\mathbb{E}[X] = 7/2$ and $\text{Var}(X) = 105/36$.
3. You have 10 pairs of socks (so 20 socks in total), with each pair being a different color. You put them in the washing machine, but the washing machine eats 4 of the socks chosen at random. Every subset of 4 socks is equally probable to be the subset that gets eaten. Let X be the number of complete pairs of socks that you have left.
 - (a) What is the probability mass function of X ?
 - (b) Find $\mathbb{E}[X]$ directly by applying the definition of expectation to the result from part (a). Give your answer exactly as a simplified fraction.
 - (c) Find $\mathbb{E}[X]$ again using linearity of expectation. Give your answer exactly as a simplified fraction.
4. Find the expected number of bins that remain empty when m balls are distributed into n bins randomly and independently. For each ball, each bin has an equal probability of being chosen. (Notice that two bins being empty are not independent events: if one bin is empty, that decreases the probability that the second bin will also be empty. This is particularly obvious when $n = 2$ and $m > 0$.)

Midterm Review Exercises (more online!)

5. Let A and B be events in the same sample space that each have nonzero probability. For the following statements, state whether it is always true, always false, or it depends on information not given.
 - (a) If A and B are mutually exclusive, then they are independent.
 - (b) If A and B are independent, then they are mutually exclusive.
 - (c) If $\mathbb{P}(A) = \mathbb{P}(B) = 0.75$, then A and B are mutually exclusive.
 - (d) If $\mathbb{P}(A) = \mathbb{P}(B) = 0.75$, then A and B are independent.
6. How many integers in $\{1, 2, \dots, 360\}$ are divisible by one or more of the numbers 2, 3, and 5?
7. A Schnapsen deck has 4 suits with 5 cards in each suit. Suppose a deck of Schnapsen cards is shuffled well and then dealt into 5 piles of 4 cards each. Let E_i refer to the event that pile i has exactly one spade. Compute the probability $\mathbb{P}(E_1 \cap E_2 \cap E_3 \cap E_4 \cap E_5)$.
8. You are working on a difficult passage from a new piece you are learning on the piano. You wish to play it correctly 4 times before stopping for the day. If your probability of playing it correctly on each attempt is $2/3$, and the attempts are independent (unfortunately!), what is the probability that you have to play it at least 8 times?
