CSE 312: Foundations of Computing II

Section 8: Joint Distributions, Law of Total Expectation (and bit of conditional distributions)

1. Review of Main Concepts

(a) **Multivariate: Discrete to Continuous:**

	Discrete	**Continuous**
Joint PMF/PDF	$p_{X,Y}(x,y) = \mathbb{P}(X = x, Y = y)$	$f_{X,Y}(x,y) \neq \mathbb{P}(X = x, Y = y)$
Joint range/support $\Omega_{X,Y}$	$\{(x,y) \in \Omega_X \times \Omega_Y : p_{X,Y}(x,y) > 0\}$	$\{(x,y) \in \Omega_X \times \Omega_Y : f_{X,Y}(x,y) > 0\}$
Joint CDF	$F_{X,Y}(x,y) = \sum_{t \le x, s \le y} p_{X,Y}(t,s)$	$F_{X,Y}(x,y) = \int_{-\infty}^{x} \int_{-\infty}^{y} f_{X,Y}(t,s)\, ds dt$
Normalization	$\sum_{x,y} p_{X,Y}(x,y) = 1$	$\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{X,Y}(x,y)\, dx dy = 1$
Marginal PMF/PDF	$p_X(x) = \sum_y p_{X,Y}(x,y)$	$f_X(x) = \int_{-\infty}^{\infty} f_{X,Y}(x,y) dy$
Expectation	$\mathbb{E}[g(X,Y)] = \sum_{x,y} g(x,y) p_{X,Y}(x,y)$	$\mathbb{E}[g(X,Y)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x,y) f_{X,Y}(x,y) dx dy$
Independence must have	$\forall x, y, p_{X,Y}(x,y) = p_X(x) p_Y(y)$ $\Omega_{X,Y} = \Omega_X \times \Omega_Y$	$\forall x, y, f_{X,Y}(x,y) = f_X(x) f_Y(y)$ $\Omega_{X,Y} = \Omega_X \times \Omega_Y$

(b) **Law of Total Probability (r.v. version):** If X is a discrete random variable, then

$$\mathbb{P}(A) = \sum_{x \in \Omega_X} \mathbb{P}(A | X = x) p_X(x) \qquad \text{discrete } X$$

(c) **Law of Total Expectation (Event Version)**: Let X be a discrete random variable, and let events $A_1, ..., A_n$ partition the sample space. Then,

$$\mathbb{E}[X] = \sum_{i=1}^{n} \mathbb{E}[X \mid A_i] \, \mathbb{P}(A_i)$$

(d) **Conditional Expectation**: See table. Note that linearity of expectation still applies to conditional expectation: $\mathbb{E}[X + Y \mid A] = \mathbb{E}[X \mid A] + \mathbb{E}[Y \mid A]$

(e) **Law of Total Expectation (RV Version)**: Suppose X and Y are random variables. Then,

$$\mathbb{E}[X] = \sum_{y} \mathbb{E}[X \mid Y = y] \, p_Y(y) \qquad \text{discrete version.}$$

(f) **Conditional distributions (not covered in class)**

	Discrete	**Continuous**
Conditional PMF/PDF	$p_{X\|Y}(x\|y) = \frac{p_{X,Y}(x,y)}{p_Y(y)}$	$f_{X\|Y}(x\|y) = \frac{f_{X,Y}(x,y)}{f_Y(y)}$
Conditional Expectation	$\mathbb{E}[X \mid Y = y] = \sum_x x p_{X\|Y}(x\|y)$	$\mathbb{E}[X \mid Y = y] = \int_{-\infty}^{\infty} x f_{X\|Y}(x\|y) dx$

(g) **The following have not been covered as of 11/19:**

- Law of Total Probability (continuous)

$$\mathbb{P}(A) = \int_{x \in \Omega_X} \mathbb{P}(A | X = x) f_X(x) dx$$

- Law of total expectation (continuous)

$$\mathbb{E}[X] = \int_{y \in \Omega_Y} \mathbb{E}[X \mid Y = y] \, f_Y(y) dy$$

2. Joint PMF's

Suppose X and Y have the following joint PMF:

X/Y	1	2	3
0	0	0.2	0.1
1	0.3	0	0.4

(a) Identify the range of X (Ω_X), the range of Y (Ω_Y), and their joint range ($\Omega_{X,Y}$).

(b) Find the marginal PMF for X, $p_X(x)$ for $x \in \Omega_X$.

(c) Find the marginal PMF for Y, $p_Y(y)$ for $y \in \Omega_Y$.

(d) Are X and Y independent? Why or why not?

(e) Find $\mathbb{E}[X^3Y]$.

3. Trinomial Distribution

A generalization of the Binomial model is when there is a sequence of n independent trials, but with three outcomes, where $\mathbb{P}(\text{outcome } i) = p_i$ for $i = 1, 2, 3$ and of course $p_1 + p_2 + p_3 = 1$. Let X_i be the number of times outcome i occurred for $i = 1, 2, 3$, where $X_1 + X_2 + X_3 = n$. Find the joint PMF $p_{X_1,X_2,X_3}(x_1, x_2, x_3)$ and specify its value for all $x_1, x_2, x_3 \in \mathbb{R}$.

4. Do You "Urn" to Learn More About Probability?

Suppose that 3 balls are chosen without replacement from an urn consisting of 5 white and 8 red balls. Let $X_i = 1$ if the i-th ball selected is white and let it be equal to 0 otherwise. Give the joint probability mass function of

(a) X_1, X_2

(b) X_1, X_2, X_3

5. Successes

Consider a sequence of independent Bernoulli trials, each of which is a success with probability p. Let X_1 be the number of failures preceding the first success, and let X_2 be the number of failures between the first 2 successes. Find the joint pmf of X_1 and X_2. Write an expression for $E[\sqrt{X_1X_2}]$. You can leave your answer in the form of a sum.

6. Continuous joint density I

The joint probability density function of X and Y is given by

$$f_{X,Y}(x,y) = \begin{cases} \frac{6}{7}\left(x^2 + \frac{xy}{2}\right) & 0 < x < 1,\ 0 < y < 2 \\ 0 & \text{otherwise.} \end{cases}$$

(a) Verify that this is indeed a joint density function.

(b) Compute the marginal density function of X.

(c) Find $Pr(X > Y)$. (Uses the continuous law of total probability which we have not covered in class as of 11/19.)

(d) Find $P(Y > \frac{1}{2} | X < \frac{1}{2})$.

(e) Find $E(X)$.

(f) Find $E(Y)$

7. Continuous joint density II

The joint density of X and Y is given by

$$f_{X,Y}(x, y) = \begin{cases} xe^{-(x+y)} & x > 0, y > 0 \\ 0 & \text{otherwise.} \end{cases}$$

and the joint density of W and V is given by

$$f_{W,V}(w, v) = \begin{cases} 2 & 0 < w < v, 0 < v < 1 \\ 0 & \text{otherwise.} \end{cases}$$

Are X and Y independent? Are W and V independent?

8. Trapped Miner

A miner is trapped in a mine containing 3 doors.

- D_1: The 1^{st} door leads to a tunnel that will take him to safety after 3 hours.
- D_2: The 2^{nd} door leads to a tunnel that returns him to the mine after 5 hours.
- D_3: The 3^{rd} door leads to a tunnel that returns him to the mine after a number of hours that is Binomial with parameters $(12, \frac{1}{3})$.

At all times, he is equally likely to choose any one of the doors. What is the expected number of hours for this miner to reach safety?

9. Lemonade Stand

Suppose I run a lemonade stand, which costs me \$100 a day to operate. I sell a drink of lemonade for \$20. Every person who walks by my stand either buys a drink or doesn't (no one buys more than one). If it is raining, n_1 people walk by my stand, and each buys a drink independently with probability p_1. If it isn't raining, n_2 people walk by my stand, and each buys a drink independently with probability p_2. It rains each day with probability p_3, independently of every other day. Let X be my profit over the next week. In terms of n_1, n_2, p_1, p_2 and p_3, what is $\mathbb{E}[X]$?

10. Particle Emissions

Suppose we are measuring particle emissions, and the number of particles emitted follows a Poisson distribution with parameter λ, $X \sim \text{Poisson}(\lambda)$. Suppose our device to measure emissions is not always entirely accurate sometimes we fail to observe particles that actually emitted. So for each particle actually emitted, say we have probability p of actually recording it, independently of other particles. Let Y be the number of particles we observed. What distribution does Y follow with what parameters, and what is $\mathbb{E}[Y]$?

11. In between

(Covers ideas that have not been covered in class.) Suppose that X_1 and X_2 are discrete uniform random variables in $\{1, \ldots, 2n\}$ (i.e., X_1 and X_2 are equally likely to take any of the values $1, \ldots, 2n$) and let $Y = \min(X_1, X_2)$. What is the conditional pmf $p_{Y|X_1}(y \mid x_1)$ and conditional CDF $F_{Y|X_1}(y \mid x_1)$. What is

$E[Y \mid X_1 = x_1]$? (For the definitions of conditional pmf, conditional CDF, see the review at the top of this worksheet.)

12. 3 points on a line

(This problem uses the continuous law of total probability which has not yet be covered in class.) Three points X_1, X_2, X_3 are selected at random on a line L (continuous independent uniform distributions). What is the probability that X_2 lies between X_1 and X_3?
