

CSE 312: Foundations of Computing II

Section 7: Continuous RVs and CLT

1. Review of Main Concepts

- (a) **Closure of the Normal Distribution:** Let $X \sim \mathcal{N}(\mu, \sigma^2)$. Then, $aX + b \sim \mathcal{N}(a\mu + b, a^2\sigma^2)$. That is, linear transformations of normal random variables are still normal.
- (b) **“Reproductive” Property of Normals:** Let X_1, \dots, X_n be independent normal random variables with $\mathbb{E}[X_i] = \mu_i$ and $\text{Var}(X_i) = \sigma_i^2$. Let $a_1, \dots, a_n \in \mathbb{R}$ and $b \in \mathbb{R}$. Then,

$$X = \sum_{i=1}^n (a_i X_i + b) \sim \mathcal{N}\left(\sum_{i=1}^n (a_i \mu_i + b), \sum_{i=1}^n a_i^2 \sigma_i^2\right)$$

There's nothing special about the parameters – the important result here is that the resulting random variable is still normally distributed.

- (c) **Law of Total Probability (Continuous):** A is an event, and X is a continuous random variable with density function $f_X(x)$.

$$\mathbb{P}(A) = \int_{-\infty}^{\infty} \mathbb{P}(A|X = x) f_X(x) dx$$

- (d) **Central Limit Theorem (CLT):** Let X_1, \dots, X_n be iid random variables with $\mathbb{E}[X_i] = \mu$ and $\text{Var}(X_i) = \sigma^2$. Let $X = \sum_{i=1}^n X_i$, which has $\mathbb{E}[X] = n\mu$ and $\text{Var}(X) = n\sigma^2$. Let $\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i$, which has $\mathbb{E}[\bar{X}] = \mu$ and $\text{Var}(\bar{X}) = \frac{\sigma^2}{n}$. \bar{X} is called the *sample mean*. Then, as $n \rightarrow \infty$, \bar{X} approaches the normal distribution $\mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right)$. Standardizing, this is equivalent to $Y = \frac{\bar{X} - \mu}{\sigma/\sqrt{n}}$ approaching $\mathcal{N}(0, 1)$. Similarly, as $n \rightarrow \infty$, X approaches $\mathcal{N}(n\mu, n\sigma^2)$ and $Y' = \frac{X - n\mu}{\sigma\sqrt{n}}$ approaches $\mathcal{N}(0, 1)$.

It is no surprise that \bar{X} has mean μ and variance σ^2/n – this can be done with simple calculations. The importance of the CLT is that, for large n , regardless of what distribution X_i comes from, \bar{X} is *approximately normally distributed with mean μ and variance σ^2/n* . Don't forget the continuity correction, only when X_1, \dots, X_n are discrete random variables.

2. Bitcoin users

There is a population of n people. The number of Bitcoin users among these n people is i with probability p_i , where, of course, $\sum_{0 \leq i \leq n} p_i = 1$. We take a random sample of k people from the population (without replacement). Use Bayes Theorem to derive an expression for the probability that there are i Bitcoin users in the population conditioned on the fact that there are j Bitcoin users in the sample. Let B_i be the event that there are i Bitcoin users in the population and let S_j be the event that there are j Bitcoin users in the sample. Your answer should be written in terms of the p_i 's, i, j, n and k .

3. Another continuous r.v.

The density function of X is given by

$$f(x) = \begin{cases} a + bx^2 & \text{when } 0 \leq x \leq 1 \\ 0 & \text{otherwise.} \end{cases}$$

If $E(X) = \frac{3}{5}$, find a and b .

4. Point on a line

A point is chosen at random on a line segment of length L . Interpret this statement and find the probability that the ratio of the shorter to the longer segment is less than $\frac{1}{4}$.

5. Min and max of i.i.d. random variables

Let X_1, X_2, \dots, X_n be i.i.d. random variables each with CDF $F_X(x)$ and pdf $f_X(x)$. Let $Y = \min(X_1, \dots, X_n)$ and let $Z = \max(X_1, \dots, X_n)$. Show how to write the CDF and pdf of Y and Z in terms of the functions $F_X(\cdot)$ and $f_X(\cdot)$.

6. Round off error

Let X be the sum of 100 real numbers, and let Y be the same sum, but with each number rounded to the nearest integer before summing. If the roundoff errors are independent and uniformly distributed between -0.5 and 0.5 , what is the approximate probability that $|X - Y| > 3$?

7. Tweets

A prolific twitter user tweets approximately 350 tweets per week. Let's assume for simplicity that the tweets are independent, and each consists of a uniformly random number of characters between 10 and 140. (Note that this is a discrete uniform distribution.) Thus, the central limit theorem (CLT) implies that the number of characters tweeted by this user is approximately normal with an appropriate mean and variance. Assuming this normal approximation is correct, estimate the probability that this user tweets between 26,000 and 27,000 characters in a particular week. (This is a case where continuity correction will make virtually no difference in the answer, but you should still use it to get into the practice!).
