CSE 312
Foundations of Computing II

Lecture 8: More on random variables; expectation

## Last Class:

- Random Variables
- Probability Mass Function (PMF)
- Cumulative Distribution Function (CDF)

Today:

- Recap
- Expectation
- Linearity of Expectation
- Indicator Random Variables

## Review Random Variables

Definition. A random variable (RV) for a probability space $(\Omega, P)$ is a function $X: \Omega \rightarrow \mathbb{R}$.

The set of values that $X$ can take on is its range/support: $X(\Omega)$ or $\Omega_{X}$

## Example: Returning Homeworks

- Class with 3 students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

| $\operatorname{Pr}(\boldsymbol{\omega})$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ |  |
| $1 / 6$ | $1,3,2$ |  |
| $1 / 6$ | $2,1,3$ |  |
| $1 / 6$ | $2,3,1$ |  |
| $1 / 6$ | $3,1,2$ |  |
| $1 / 6$ | $3,2,1$ |  |

## Review Random Variables

Definition. A random variable (RV) for a probability space $(\Omega, P)$ is a function $X: \Omega \rightarrow \mathbb{R}$.

The set of values that $X$ can take on is its range/support: $X(\Omega)$ or $\Omega_{X}$
$\left\{X=x_{i}\right\}=\left\{\omega \in \Omega \mid X(\omega)=x_{i}\right\}$
Random variables partition the sample space.

$$
\Sigma_{x \in X(\Omega)} P(X=x)=1
$$

## Example: Returning Homeworks

- Class with 3 students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

| $\operatorname{Pr}(\omega)$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

## Review PMF and CDF

## Definitions:

For a RV $X: \Omega \rightarrow \mathbb{R}$, the probability mass function (pmf) of $X$ specifies, for any real number $x$, the probability that $X=x$

$$
p_{X}(x)=P(X=x)=P(\{\omega \in \Omega \mid X(\omega)=x\})
$$

$$
\sum_{x \in \Omega_{X}} p_{X}(x)=1
$$

For a RV $X: \Omega \rightarrow \mathbb{R}$, the cumulative distribution function (cdf) of $X$ specifies, for any real number $x$, the probability that $X \leq x$

$$
F_{X}(x)=P(X \leq x)
$$

## Example - Two fair independent coin flips

## Example: Returning Homeworks

- Class with 3 students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

| $\operatorname{Pr}(\boldsymbol{\omega})$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

## Example - Number of Heads

We flip $n$ coins, independently, each heads with probability $p$
$\Omega=\{$ HH $\cdots$ HH, HH $\cdots$ HT, HH $\cdots$ TH, $\ldots$, TT $\cdots$ TT $\}$
$X=$ \# of heads

$$
p_{X}(k)=P(X=k)=
$$

## Example - Number of Heads

We flip $n$ coins, independently, each heads with probability $p$
$\Omega=\{$ HH $\cdots$ HH, HH $\cdots$ HT, HH $\cdots$ TH, $\ldots$, TT $\cdots$ TT $\}$
$X=$ \# of heads

## Agenda

- Random Variables
- Probability Mass Function (PMF)
- Cumulative Distribution Function (CDF)
- Expectation

## Expectation (Idea)

Example. Toss a coin 20 times independently with probability $1 / 4$ of coming up heads on each toss.
$X=$ number of heads

How many heads do you expect to see?

What if you toss it independently $n$ times and it comes up heads with probability $p$ each time?

## Review Expected Value of a Random Variable

Definition. Given a discrete RV $X: \Omega \rightarrow \mathbb{R}$, the expectation or expected value or mean of $X$ is

$$
\mathbb{E}[X]=\sum_{\omega \in \Omega} X(\omega) \cdot P(\omega)
$$

or equivalently

$$
\mathbb{E}[X]=\sum_{x \in \mathrm{X}(\Omega)} x \cdot P(X=x)=\sum_{x \in \Omega_{X}} x \cdot p_{X}(x)
$$

Intuition: "Weighted average" of the possible outcomes (weighted by probability)

## Expectation

Example. Two fair coin flips

$$
\begin{aligned}
& \Omega=\{\mathrm{TT}, \mathrm{HT}, \mathrm{TH}, \mathrm{HH}\} \\
& X=\text { number of heads }
\end{aligned}
$$

## $p_{X}$

$$
\begin{aligned}
& \mathbb{E}[X]=\sum_{\omega \in \Omega} X(\omega) \cdot P(\omega) \\
& \mathbb{E}[X]=\sum_{x \in \mathrm{X}(\Omega)} x \cdot P(X=x)
\end{aligned}
$$

## What is $\mathbb{E}[X]$ ?

$$
\begin{aligned}
& \mathbb{E}[X]=0 \cdot p_{X}(0)+1 \cdot p_{X}(1)+2 \cdot p_{X}(2) \\
&=0 \cdot \frac{1}{4}+1 \cdot \frac{1}{2}+2 \cdot \frac{1}{4}=\frac{1}{2}+\frac{1}{2}=1 \\
& 0
\end{aligned}
$$

## Example: Returning Homeworks

$$
\begin{aligned}
& \mathbb{E}[X]=\sum_{\omega \in \Omega} X(\omega) \cdot P(\omega) \\
& \mathbb{E}[X]=\sum_{x \in X(\Omega)} x \cdot P(X=x)
\end{aligned}
$$

- Class with 3 students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW
- What is $\mathbb{E}[X]$ ?

| $\operatorname{Pr}(\omega)$ | $\omega$ | $X(\omega)$ |
| :---: | :---: | :---: |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $3,2,1$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $1,2,3$ | 3 |

## Example: Returning Homeworks

- Class with 3 students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

| $\operatorname{Pr}(\omega)$ | $\omega$ | $X(\omega)$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

$$
\begin{aligned}
\mathbb{E}[X] & =3 \cdot \frac{1}{6}+1 \cdot \frac{1}{6}+1 \cdot \frac{1}{6}+0 \cdot \frac{1}{6}+0 \cdot \frac{1}{6}+1 \cdot \frac{1}{6} \\
& =6 \cdot \frac{1}{6}=1
\end{aligned}
$$

## Example - Flipping a biased coin until you see heads

- Biased coin, each flip indep:

$$
\begin{aligned}
& P(H)=q>0 \\
& P(T)=1-q
\end{aligned}
$$

- $Z=\#$ of coin flips until first head

$$
P(Z=i)=
$$

$$
\mathbb{E}[Z]=
$$

## Example - Flipping a biased coin until you see heads

- Biased coin, each flip indep:

$$
\begin{aligned}
& P(H)=q>0 \\
& P(T)=1-q
\end{aligned}
$$

- $Z=\#$ of coin flips until first head

$$
\begin{aligned}
& P(Z=i)=q(1-q)^{i-1} \\
& \mathbb{E}[Z]=\sum_{i=1}^{\infty} i \cdot P(Z=i)=\sum_{i=1}^{\infty} i \cdot q(1-q)^{i-1}
\end{aligned}
$$

$$
\text { Converges, so } \mathbb{E}[Z] \text { is finite }
$$

Can calculate this directly but...

## Example - Flipping a biased coin until you see heads

- Biased coin, each flip indep:

$$
\begin{aligned}
& P(H)=q>0 \\
& P(T)=1-q
\end{aligned}
$$

- $Z=\#$ of coin flips until first head

Another view: If you get heads first try you get $Z=1$;
If you get tails you have used one try and have the same experiment left
$\mathbb{E}[Z]=$

## Example - Flipping a biased coin until you see heads

- Biased coin:

$$
\begin{aligned}
& P(H)=q>0 \\
& P(T)=1-q
\end{aligned}
$$

Another view: If you get heads first try you get $Z=1$;
If you get tails you have used one try and have the same experiment left

$$
\mathbb{E}[Z]=q \cdot 1+(1-q)(1+\mathbb{E}(Z))
$$

Solving gives $\quad q \cdot \mathbb{E}[Z]=q+(1-q)=1$ Implies $\mathbb{E}[Z]=1 / q$

## Example - Coin Tosses

We flip $n$ coins, each toss independent, probability $p$ of coming up heads.
$Z$ is the number of heads, what is $\mathbb{E}(Z)$ ?

## Example - Coin Tosses

We flip $n$ coins, each toss independent; heads with probability $p$, $Z$ is the number of heads, what is $\mathbb{E}[Z]$ ?

$$
\begin{aligned}
\mathbb{E}[Z] & =\sum_{k=0}^{n} k \cdot P(Z=k)=\sum_{k=0}^{n} k \cdot\binom{n}{k} p^{k}(1-p)^{n-k} \\
& =\sum_{k=0}^{n} k \cdot \frac{n!}{k!(n-k)!} p^{k}(1-p)^{n-k}=\sum_{k=1}^{n} \frac{n!}{(k-1)!(n-k)!} p^{k}(1-p)^{n-k}
\end{aligned}
$$

$$
=n p \sum_{k=1}^{n} \frac{(n-1)!}{(k-1)!(n-k)!} p^{k-1}(1-p)^{n-k}
$$

Can we solve it more

$$
=n p \sum_{k=0}^{n-1} \frac{(n-1)!}{k!(n-1-k)!} p^{k}(1-p)^{(n-1)-k}
$$ elegantly, please?

$=n p \sum_{k=0}^{n-1}\binom{n-1}{k} p^{k}(1-p)^{(n-1)-k}=n p(p+(1-p))^{n-1}=n p \cdot 1=n p$

## Agenda

- Random Variables
- Probability Mass Function (PMF)
- Cumulative Distribution Function (CDF)
- Expectation
- Linearity of Expectation

## Linearity of Expectation

Theorem. For any two random variables $X$ and $Y$
(no conditions whatsoever on the random variables)

$$
\mathbb{E}[X+Y]=\mathbb{E}[X]+\mathbb{E}[Y] .
$$

Or, more generally: For any random variables $X_{1}, \ldots, X_{n}$,

$$
\mathbb{E}\left[X_{1}+\cdots+X_{n}\right]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right] .
$$

Because: $\mathbb{E}\left[X_{1}+\cdots+X_{n}\right]=\mathbb{E}\left[\left(X_{1}+\cdots+X_{n-1}\right)+X_{n}\right]$

$$
=\mathbb{E}\left[X_{1}+\cdots+X_{n-1}\right]+\mathbb{E}\left[X_{n}\right]=\cdots
$$

## Linearity of Expectation - Proof

Theorem. For any two random variables $X$ and $Y$
( $X, Y$ do not need to be independent)

$$
\mathbb{E}[X+Y]=\mathbb{E}[X]+\mathbb{E}[Y] .
$$

$$
\begin{aligned}
\mathbb{E}[X+Y] & =\sum_{\omega} P(\omega)(X(\omega)+Y(\omega)) \\
& =\sum_{\omega} P(\omega) X(\omega)+\sum_{\omega} P(\omega) Y(\omega) \\
& =\mathbb{E}[X]+\mathbb{E}[Y]
\end{aligned}
$$

## Using LOE to compute complicated expectations

Often boils down to the following three steps:

- Decompose: Finding the right way to decompose the random variable into sum of simple random variables

$$
X=X_{1}+\cdots+X_{n}
$$

- LOE: Apply linearity of expectation.

$$
\mathbb{E}[X]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right] .
$$

- Conquer: Compute the expectation of each $X_{i}$

Often, $X_{i}$ are indicator (o/1) random variables.

## Indicator random variables - 0/1 valued

For any event $A$, can define the indicator random variable $X_{A}$ for $A$

$$
X_{A}=\left\{\begin{array}{ll|}
1 & \text { if event } A \text { occurs } \\
0 & \text { if event } A \text { does not occur }
\end{array} \begin{array}{l}
P\left(X_{A}=1\right)=P(A) \\
P\left(X_{A}=0\right)=1-P(A)
\end{array}\right.
$$

## Example - Coin Tosses - The brute force method

We flip $n$ coins, each one heads with probability $p$, $Z$ is the number of heads, what is $\mathbb{E}[Z]$ ?

$$
\begin{aligned}
\mathbb{E}[Z] & =\sum_{k=0}^{n} k \cdot P(Z=k)=\sum_{k=0}^{n} k \cdot\binom{n}{k} p^{k}(1-p)^{n-k} \\
& =\sum_{k=0}^{n} k \cdot \frac{n!}{k!(n-k)!} p^{k}(1-p)^{n-k}=\sum_{k=1}^{n} \frac{n!}{(k-1)!(n-k)!} p^{k}(1-p)^{n-k}
\end{aligned}
$$

$$
=n p \sum_{k=1}^{n} \frac{(n-1)!}{(k-1)!(n-k)!} p^{k-1}(1-p)^{n-k}
$$

Can we solve it more

$$
=n p \sum_{k=0}^{n-1} \frac{(n-1)!}{k!(n-1-k)!} p^{k}(1-p)^{(n-1)-k}
$$ elegantly, please?

$=n p \sum_{k=0}^{n-1}\binom{n-1}{k} p^{k}(1-p)^{(n-1)-k}=n p(p+(1-p))^{n-1}=n p \cdot 1=n p$

## Computing complicated expectations

Often boils down to the following three steps:

- Decompose: Finding the right way to decompose the random variable into sum of simple random variables

$$
X=X_{1}+\cdots+X_{n}
$$

- LOE: Apply linearity of expectation.

$$
\mathbb{E}[X]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right] .
$$

- Conquer: Compute the expectation of each $X_{i}$

Often, $X_{i}$ are indicator (o/1) random variables.

## Example - Coin Tosses

We flip $n$ coins, each toss independent, comes up heads with probability $p$ $Z$ is the number of heads, what is $\mathbb{E}[Z]$ ?

$$
X_{i}=\left\{\begin{array}{l}
1, i^{\text {th }} \text { coin flip is heads } \\
0, i^{\text {th }} \text { coin flip is tails. }
\end{array}\right.
$$

Fact. $Z=X_{1}+\cdots+X_{n}$

| Outcome | $X_{1}$ | $X_{2}$ | $X_{3}$ | $Z$ |
| :--- | :---: | :---: | :---: | :---: |
| TTT | 0 | 0 | 0 | 0 |
| TTH | 0 | 0 | 1 | 1 |
| THT | 0 | 1 | 0 | 1 |
| THH | 0 | 1 | 1 | 2 |
| HTT | 1 | 0 | 0 | 1 |
| HTH | 1 | 0 | 1 | 2 |
| HHT | 1 | 1 | 0 | 2 |
| HHH | 1 | 1 | 1 | 3 |

## Example - Coin Tosses

We flip $n$ coins, each toss independent, comes up heads with probability $p$ $Z$ is the number of heads, what is $\mathbb{E}[Z]$ ?

- $X_{i}= \begin{cases}1, & i^{\text {th }} \text { coin flip is heads } \\ 0, & i^{\text {th }} \text { coin flip is tails. }\end{cases}$

Fact. $Z=X_{1}+\cdots+X_{n}$

Linearity of Expectation:

$$
\mathbb{E}[Z]=\mathbb{E}\left[X_{1}+\cdots+X_{n}\right]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right]=n \cdot p
$$

$$
\begin{aligned}
& P\left(X_{i}=1\right)=p \\
& P\left(X_{i}=0\right)=1-p
\end{aligned}
$$

$$
\mathbb{E}\left[X_{i}\right]=p \cdot 1+(1-p) \cdot 0=p
$$

## Example: Returning Homeworks

- Class with $n$ students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

What is $\mathbb{E}[X]$ ? Use linearity of expectation!

| $\operatorname{Pr}(\boldsymbol{\omega})$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

Decompose: Find the right way to decompose the random variable into sum of simple random variables

$$
X=X_{1}+\cdots+X_{n}
$$

LOE: Apply linearity of expectation.

$$
\mathbb{E}[X]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right]
$$

Conquer: Compute the expectation of each $X_{i}$ and sum!

## Example: Returning Homeworks

- Class with $n$ students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW

What is $\mathbb{E}[X]$ ? Use linearity of expectation!

## Decompose:

| $\operatorname{Pr}(\boldsymbol{\omega})$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

## Example: Returning Homeworks

- Class with $n$ students, randomly hand back homeworks. All permutations equally likely.
- Let $X$ be the number of students who get their own HW What is $\mathbb{E}[X]$ ? Use linearity of expectation!

Decompose: What is $X_{i}$ ?

| $\operatorname{Pr}(\boldsymbol{\omega})$ | $\boldsymbol{\omega}$ | $\boldsymbol{X}(\boldsymbol{\omega})$ |
| :---: | :---: | :---: |
| $1 / 6$ | $1,2,3$ | 3 |
| $1 / 6$ | $1,3,2$ | 1 |
| $1 / 6$ | $2,1,3$ | 1 |
| $1 / 6$ | $2,3,1$ | 0 |
| $1 / 6$ | $3,1,2$ | 0 |
| $1 / 6$ | $3,2,1$ | 1 |

$X_{i}=1$ iff $i^{\text {th }}$ student gets own HW back
LOE: $\mathbb{E}[X]=\mathbb{E}\left[X_{1}\right]+\cdots+\mathbb{E}\left[X_{n}\right]$
Conquer: $\mathbb{E}\left[X_{i}\right]=\frac{1}{n}$
Therefore, $\mathbb{E}[X]=n \cdot \frac{1}{n}=1$

## Pairs with the same birthday

- In a class of $m$ students, on average how many pairs of people have the same birthday (assuming 365 equally likely birthdays)?

## Pairs with the same birthday

- In a class of $m$ students, on average how many pairs of people have the same birthday (assuming 365 equally likely birthdays)?

Decompose: Indicator events involve pairs of students $(i, j)$ for $i \neq j$

$$
X_{i j}=1 \text { iff students } i \text { and } j \text { have the same birthday }
$$

LOE: $\binom{m}{2}$ indicator variables $X_{i j}$
Conquer: $\mathbb{E}\left[X_{i j}\right]=\frac{1}{365}$ so total expectation is $\frac{\binom{m}{2}}{365}=\frac{m(m-1)}{730}$ pairs

## Linearity of Expectation - Even stronger

Theorem. For any random variables $X_{1}, \ldots, X_{n}$, and real numbers $a_{1}, \ldots, a_{n} \in \mathbb{R}$,

$$
\mathbb{E}\left[a_{1} X_{1}+\cdots+a_{n} X_{n}\right]=a_{1} \mathbb{E}\left[X_{1}\right]+\cdots+a_{n} \mathbb{E}\left[X_{n}\right] .
$$
