

## Near the mean

Suppose you run a poll of 1000 people where in the true population 60% of the population supports you. What is the probability that the poll is not within 10-percentage-points of the true value?

$$\bar{X} = \sum X_i / 1000$$

$$\mathbb{E}[\bar{X}]$$

$$\text{Var}(\bar{X})$$

### Chebyshev's Inequality

Let  $X$  be a random variable. For any  $t > 0$

$$\mathbb{P}(|X - \mathbb{E}[X]| \geq t) \leq \frac{\text{Var}(X)}{t^2}$$

1

## Left Tail

Suppose you run a poll of 1000 people where in the true population 60% of the population supports you. What is the probability that the poll is not within 10-percentage-points of the true value?

$$\text{Want } \mathbb{P}\left(\frac{X}{1000} \leq .5\right) = \mathbb{P}(X \leq .5 \cdot 1000)$$

### Chernoff Bound (left tail)

Let  $X_1, X_2, \dots, X_n$  be *independent* Bernoulli random variables.

Let  $X = \sum X_i$ , and  $\mu = \mathbb{E}[X]$ . For any  $0 \leq \delta \leq 1$

$$\mathbb{P}(X \leq (1 - \delta)\mu) \leq \exp\left(-\frac{\delta^2 \mu}{2}\right)$$

2

## One More Bound

The Union bound

### Union Bound

$$\text{For any events } E, F \\ \mathbb{P}(E \cup F) \leq \mathbb{P}(E) + \mathbb{P}(F)$$

Proof?  $\mathbb{P}(E \cup F) = \mathbb{P}(E) + \mathbb{P}(F) - \mathbb{P}(E \cap F)$

And  $\mathbb{P}(E \cap F) \geq 0$ .

3

## Frogs

There are 20 frogs on each location in a 5x5 grid. Each frog will independently jump to the left, right, up, down, or stay where it is with equal probability. A frog at an edge of the grid magically warps to the corresponding edge (pac-man-style).

Bound the probability that at least one square ends up with at least 36 frogs.
