1. For the context-free grammar $G_4$ given in Example 2.3, show a parse tree for the string $a \times (a \times a) \times (a + a)$.

2. In class we saw how to construct a context-free grammar $G$, from a given deterministic finite automaton $M$, such that $L(G) = L(M)$. There was a central claim

$$q_i \Rightarrow_G^* wq_j \text{ iff } (q_i, w) \xrightarrow{\text{M}}^* (q_j, \varepsilon)$$

that I left unproved, where $q_i, q_j \in Q$ and $w \in \Sigma^*$. Prove this claim by induction on $|w|$.

3. Give a context-free grammar $G$ such that

$$L(G) = \{ w \in \{0, 1\}^* \mid w \text{ has an equal number of 0s and 1s} \}.$$

You need not turn in a proof of correctness, though it would be good reassurance for yourself to do such a proof.

4. Exercise 2.6(c). You need not turn in a proof of correctness, though it would be good reassurance for yourself to do such a proof.

5. Problem 2.15.

6. Problem 2.16.
