## What's on our platter today?

- Cliff's notes for equivalence of CFGs and PDAs
$\Rightarrow L=L(G)$ for some $C F G G \Rightarrow L=L(M)$ for some PDA $M$
$\Rightarrow L=L(M)$ for some PDA $M \Rightarrow L=L(G)$ for some CFG $G$
- Pumping Lemma (one last time)
$\Rightarrow$ Statement of Pumping Lemma for CFLs
$\Rightarrow$ Application: Showing a given $L$ is not a CFL

## Review: From CFGs to PDAs

- L is a $\mathrm{CFL} \Rightarrow \mathrm{L}=\mathrm{L}(\mathrm{M})$ for some PDA M
- Proof Summary:
$\Rightarrow L$ is a CFL means $L=L(G)$ for some $C F G G=(V, \Sigma, R, S)$
$\Rightarrow$ Construct PDA M $=\left(\mathrm{Q}, \Sigma, \Gamma, \delta, \mathrm{q}_{0},\left\{\mathrm{q}_{\mathrm{acc}}\right\}\right)$ M has only 4 main states (plus a few more for pushing strings) $\mathrm{Q}=\left\{\mathrm{q}_{0}, \mathrm{q}_{1}, \mathrm{q}_{2}, \mathrm{q}_{\text {acc }}\right\} \cup \mathrm{E}$ where E are states used in 2 below
$\Rightarrow \delta$ has 4 components:

1. Init. Stack: $\delta\left(\mathrm{q}_{0}, \varepsilon, \varepsilon\right)=\left\{\left(\mathrm{q}_{1}, \$\right)\right\}$ and $\delta\left(\mathrm{q}_{1}, \varepsilon, \varepsilon\right)=\left\{\left(\mathrm{q}_{2}, \mathrm{~S}\right)\right\}$
2. Push \& generate strings: $\delta\left(\mathrm{q}_{2}, \varepsilon, \mathrm{~A}\right)=\left\{\left(\mathrm{q}_{2}, \mathrm{w}\right)\right\}$ for $\mathrm{A} \rightarrow \mathrm{w}$ in R
3. Pop \& match to input: $\delta\left(\mathrm{q}_{2}, \mathrm{a}, \mathrm{a}\right)=\left\{\left(\mathrm{q}_{2}, \varepsilon\right)\right\}$
4. Accept if stack empty: $\delta\left(\mathrm{q}_{2}, \varepsilon, \$\right)=\left\{\left(\mathrm{q}_{\text {acc }}, \varepsilon\right)\right\}$

- Can prove by induction: $w \in L$ iff $w \in L(M)$

## Review: From PDAs to CFGs

- L $=\mathrm{L}(\mathrm{M})$ for some PDA $M \Rightarrow \mathrm{~L}=\mathrm{L}(\mathrm{G})$ for some CFG $G$
- Proof Summary: Simulate M's computation using a CFG
$\Rightarrow$ First, simplify M: 1. Only 1 accept state, 2 . M empties stack before accepting, 3. Each transition either Push or Pop, not both or neither. Let $\mathrm{M}=\left(\mathrm{Q}, \Sigma, \Gamma, \delta, \mathrm{q}_{0},\left\{\mathrm{q}_{\text {acc }}\right\}\right)$
$\Rightarrow$ Construct grammar $\mathrm{G}=(\mathrm{V}, \Sigma, \mathrm{R}, \mathrm{S})$
$\Rightarrow$ Basic Idea: Define variables $\mathrm{A}_{\mathrm{pq}}$ for simulating M
$\Rightarrow \mathrm{A}_{\mathrm{pq}}$ generates all strings w such that w takes M from state p with empty stack to state $q$ with empty stack
$\Rightarrow$ Then, $\mathrm{A}_{\text {q0qacc }}$ generates all strings w accepted by M

## Review: From PDAs to CFGs (cont.)

- $\mathrm{L}=\mathrm{L}(\mathrm{M})$ for some PDA $\mathrm{M} \Rightarrow \mathrm{L}=\mathrm{L}(\mathrm{G})$ for some CFG G
- Proof (cont.)
$\Rightarrow$ Construct grammar $G=(V, \Sigma, R, S)$ where
$\mathrm{V}=\left\{\mathrm{A}_{\mathrm{pq}} \mid \mathrm{p}, \mathrm{q} \in \mathrm{Q}\right)$
$\mathrm{S}=\mathrm{A}_{\mathrm{q} 0 \mathrm{qacc}}$
$\mathrm{R}=\left\{\mathrm{A}_{\mathrm{pq}} \rightarrow \mathrm{aA}_{\mathrm{rs}} \mathrm{b} \mid \mathrm{p} \xrightarrow{\mathrm{a}, \varepsilon \rightarrow \mathrm{c}} \xrightarrow{\mathrm{A}_{\mathrm{rs}}} \mathrm{s} \xrightarrow{\mathrm{b}, \mathrm{c} \rightarrow \varepsilon} \mathrm{q}\right\}$
$\cup\left\{\mathrm{A}_{\mathrm{pq}} \rightarrow \mathrm{A}_{\mathrm{pr}} \mathrm{A}_{\mathrm{rq}} \mid \mathrm{p}, \mathrm{q}, \mathrm{r} \in \mathrm{Q}\right\}$
$\cup\left\{\mathrm{A}_{\mathrm{qq}} \rightarrow \varepsilon \mid \mathrm{q} \in \mathrm{Q}\right\}$
- See text for proof by induction: w $\in L(M)$ iff $w \in L(G)$
$\uparrow$ Try to get G from M where $\mathrm{L}(\mathrm{M})=\left\{0^{\mathrm{n}} 1^{\mathrm{n}} \mid \mathrm{n} \geq 1\right\}$

## Pumping Lemma for CFLs

- Intuition: If L is CF, then some CFG G produces strings in $L$
$\Rightarrow$ If some string in L is very long, it will have a very tall parse tree
$\Rightarrow$ If a parse tree is taller than the number of distinct variables in G, then some variable A repeats $\Rightarrow \mathrm{A}$ will have at least two sub-trees
$\Rightarrow$ We can pump up the original string by replacing A's smaller subtree with larger, and pump down by replacing larger with smaller
- Pumping Lemma for CFLs in all its glory:
$\Rightarrow$ If L is a CFL, then there is a number p (the "pumping length") such that for all strings $s$ in L such that $|s| \geq \mathrm{p}$, there exist $u, v, x, y$, and $z$ such that $s=u v x y z$ and:

1. $u v^{i} x y^{i} z \in \mathrm{~L}$ for all $i \geq 0$, and
2. $|v y| \geq 1$, and
3. $|v x y| \leq \mathrm{p}$.

## Why is the PL useful?

- Can use the pumping lemma to show a language L is not context-free
$\Rightarrow 5$ steps for a proof by contradiction:

1. Assume L is a CFL.
2. Let p be the pumping length for L given by the pumping lemma for CFLs.
3. Choose cleverly an $s$ in L of length at least p , such that
4. For all possible ways of decomposing $s$ into $u v x y z$, where $|v y| \geq 1$ and $|v x y| \leq \mathrm{p}$,
5. Choose an $i \geq 0$ such that $u v^{i} x y^{i} z$ is not in L.

- Example (on board): Show the following is not a CFL
$\Rightarrow L=\left\{0^{n} 1^{n} 0^{n} \mid n \geq 0\right\}$

## Example 2

- Show $\mathrm{L}=\left\{0^{\mathrm{n}} \mid \mathrm{n}\right.$ is a prime number $\}$ is not a CFL

1. Assume L is a CFL.
2. Let p be the pumping length for L given by the pumping lemma for CFLs.
3. Let $\mathrm{s}=0^{\mathrm{n}}$ where n is a prime $\geq \mathrm{p}$
4. Consider all possible ways of decomposing $s$ into $u v x y z$, where $|v y| \geq 1$ and $|v x y| \leq \mathrm{p}$.
Then, $v y=0^{\mathrm{r}}$ and $u x z=0^{\mathrm{q}}$ where $\mathrm{r}+\mathrm{q}=\mathrm{n}$ and $\mathrm{r} \geq 1$
5. We need an $i \geq 0$ such that $u v^{i} x y^{i} z=0^{i+q}$ is not in L .
( $i=0$ won't work because q could be prime: e.g. $2+17=19$ )
Choose $i=(\mathrm{q}+2+2 \mathrm{r})$. Then, $i \mathrm{r}+\mathrm{q}=\mathrm{qr}+2 \mathrm{r}+2 \mathrm{r}^{2}+\mathrm{q}=$ $\mathrm{q}(\mathrm{r}+1)+2 \mathrm{r}(\mathrm{r}+1)=(\mathrm{q}+2 \mathrm{r})(\mathrm{r}+1)=$ not prime (since $\mathrm{r} \geq 1)$.
So, $0^{i r+q}$ is not in $\mathrm{L} \Rightarrow$ contradicts pumping lemma. L is not a CFL.

## Two surprising results about CFLs

$\uparrow$ CFLs are not closed under intersection
$\Rightarrow$ Proof: $\mathrm{L}_{1}=\left\{0^{\mathrm{n}} 1^{\mathrm{n}} 0^{\mathrm{m}} \mid \mathrm{n}, \mathrm{m} \geq 0\right\}$ and $\mathrm{L}_{2}=\left\{0^{\mathrm{m}} 1^{\mathrm{n}} 0^{\mathrm{n}} \mid \mathrm{n}, \mathrm{m} \geq 0\right\}$ are both CFLs but $L_{1} \cap L_{2}=\left\{0^{n} 1^{n} 0^{n} \mid n \geq 0\right\}$ is not a CFL.

- CFLs are not closed under complementation

## $\Rightarrow$ Proof by contradiction:

Suppose CFLs are closed under complement.
Then, for $\mathrm{L}_{1}, \mathrm{~L}_{2}$ above, $\overline{\overline{\mathrm{L}}}_{1} \cup \overline{\mathrm{~L}}_{2}$ must be a CFL (since CFLs are closed under $\cup$-- see this week's homework).
But, $\overline{\bar{L}}_{1} \cup \overline{\mathrm{~L}}_{2}=\mathrm{L}_{1} \cap \mathrm{~L}_{2}$ (by de Morgan's law).
$\mathrm{L}_{1} \cap \mathrm{~L}_{2}=\left\{0^{\mathrm{n}} 1^{\mathrm{n}} 0^{\mathrm{n}} \mid \mathrm{n} \geq 0\right\}$ is not a CFL $\Rightarrow$ contradiction.
Therefore CFLs are not closed under complementation.

## Can we make PDAs more powerful?

- What if we allow arbitrary reads/writes to the stack instead of only push and pop?

Next Class: Enter...the Turing Machine

To Do:

- Homework \#6 on the class website
- Start reading Chapter 3
- Watch "Footloose" (in fast-forward mode)
