

CSE 326: Data Structures

Topic #10: Hashing (3)

Ashish Sabharwal
Autumn, 2003

Today's Outline

- Admin:
 - Hardcopy turnin for Project 2 – *now!*
 - Homework 2 due Friday
 - Start looking for a partner for Project 3 (must be someone different from your Project 2 partner)
- Finish **Hashing**
 - Double hashing, rehashing
 - Extensible hashing
- Group Quiz #4

2

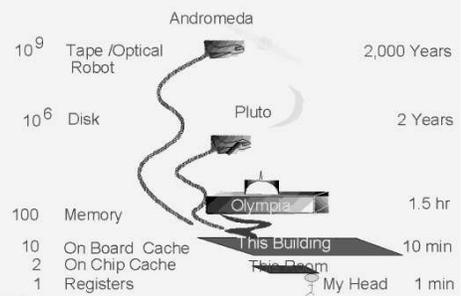

When to Rehash?

Many alternatives:

- Rehash when table is half full
- Rehash when insertion fails in open addressing
- Rehash when insertion becomes very slow in separate chaining
- Rehash when λ crosses a certain threshold

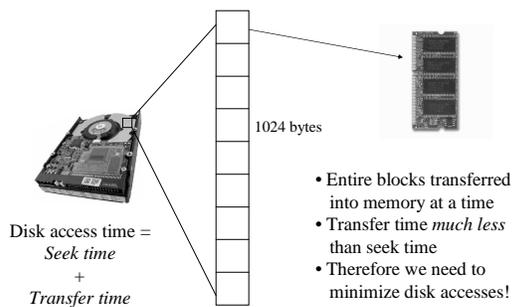

3

Something We Again Forgot: Disk Accesses

Jim Gray

We Want To Minimize Disk Accesses!

5

Solution: Extensible Hashing

Hashing technique for huge data sets

- Optimizes to reduce disk accesses

Hash "table" contains

1. Directory
 2^D entries, D bits per entry, pointers to leaf buckets
2. Leaf Buckets
Keys in leaf L have $d_L \leq D$ bits in common with parent key, leaves store all data

Properties

- Only 2 levels in the table – only 2 disk accesses for find!
- Each leaf bucket fits on one disk block – caching
- Better than B-Trees if order is not important – *why?*

6

Extendible Hash Table

Directory entry : *key prefix* (first D bits) and a pointer to the bucket with all keys starting with that prefix

Bucket entry : keys matching on first $d_L \leq D$ bits, plus the data associated with those keys

Directory for $D = 3$

000	001	010	011	100	101	110	111
-----	-----	-----	-----	-----	-----	-----	-----

$(d_L = 2)$	$(d_L = 2)$	$(d_L = 3)$	$(d_L = 3)$	$(d_L = 2)$
00001 + data 00011 + data 00100 + data 00110 + data	01001 01011 01100	10001 10011	10101 10110 10111	11001 11100 11110

Bucket size = 4

insert(11010)?
insert(11011)?

7

Inserting Using Bucket-Split

Directory for $D = 3$

000	001	010	011	100	101	110	111
-----	-----	-----	-----	-----	-----	-----	-----

$(d_L = 2)$	$(d_L = 2)$	$(d_L = 3)$	$(d_L = 3)$	$(d_L = 3)$	$(d_L = 3)$
00001 + data 00011 + data 00100 + data 00110 + data	01001 01011 01100	10001 10011	10101 10110 10111	11001 11010 11011 11011	11100 11110

Bucket size = 4 **Split**

8

Insertion Using Directory-Expansion

- insert(10010)
But, no room to insert, only one parent, and *no adoption!*
- Solution:
Expand directory
Now do a bucket-split

$D = 2$

00	01	10	11
----	----	----	----

(2) 01101	(2) 10000 10001 10011 10111	(2) 11001 11110
--------------	---	-----------------------

→

000	001	010	011	100	101	110	111
-----	-----	-----	-----	-----	-----	-----	-----

$D = 3$

More expensive!

How to ensure this is uncommon?

9

What if Extendible Hashing Doesn't Cut It?

Option 1: Store only pointers/references to the items:
(key, value) pairs separately on disk

Option 2: Improve hash function; Rehash

10

The One-Slide Hash

Hash function: maps keys to integers

Collision resolution

- Separate Chaining
 - Expand beyond hashtable via secondary Dictionaries
 - Allows $\lambda > 1$
- Open Addressing
 - Expand within hashtable
 - Secondary probing: {linear, quadratic, double hash}
 - $\lambda \leq 1$ (by definition!)
 - $\lambda \leq 1/2$ (by preference!)

Choosing a Hash Function

- Make sure table size is prime
- Careful choice for strings
- "Perfect hashing"**
 - If keys known in advance, tune hash function for them!

Rehashing

- Tunes up hashtable when, e.g., λ crosses a threshold

Extendible hashing

- For disk-based data

11

Search ADT Implementations

	insert	find	delete
• Unsorted list	$\Theta(1)$	$\Theta(n)$	$\Theta(n)$
• Sorted list	$\Theta(n)$	$\Theta(\log n)?$	$\Theta(n)$
• Trees	$\Theta(\log n)$	$\Theta(\log n)$	$\Theta(\log n)$
• Hash Table	$\Theta(1)$	$\Theta(1)$	$\Theta(1)$

(average case)

Is there anything a hash table *cannot* do efficiently?

You'll answer this in quiz #4!

12
